UTILIS[®]
Tooling for High Technology

Welcome!

The UTILIS principle: We work hand in hand together with you. This allows us to know and understand what you need. And this knowledge is our driving force for the next "multidec® innovation".

For more than 25 years we have been developing outstanding precision tools under our own "multidec®" brand which are specifically designed to meet the challenges of the watch, medical and dental industries. We have now gone far beyond this, and also cover the automotive, aerospace and electronics industries, as well as many other areas.

Dear customers and partners, we are once again presenting our well-established products and also many new items and product extensions in the usual way in this new edition. Please don't hesitate to continue presenting us with your challenges, so that we can collaborate to find the best solution for you.

I am certain that we'll succeed in finding it!

On behalf of the entire team, I would like to thank you for your many years of loyalty and the many exciting and successful years to come.

We hope that our products and services bring you success and particularly enjoyment.

Yours Sincerely,
Your Mario, CEO

Future since 1915 – ideas change the world

UTILIS AG is one of the world's leading providers in the area of precision tools for micro-cutting—your partner for machining. We have been developing technologically leading solutions for more than 100 years, and provide you with top class technology in our products and services.

In the second half of the 19th century, in 1868 to be precise, the Ernst brothers founded a mechanical workshop in Müllheim. On November 9th 1915, this became a public limited company—the year in which UTILIS AG was born. From then on things proceeded step by step in a continuous and committed way.

Do you know what “UTILIS” stands for?

Utilitarian: “with regard to the benefits” or “utility-based” or “person who only focuses on the benefits”

Since the establishment of the company, our declared goal has been to develop and manufacture high-quality tools which provide our customers with a long-term benefit. We are not looking for short-term gain, but long-term value generation by means of market leadership and differentiation.

For us as a traditional, medium-sized Swiss family-run company, it is natural to make quality and customer proximity the highest priority. The products, technologies and services of UTILIS are something special.

Our claim: We provide you with products that set standards in all areas. We can only achieve this by our own researching, developing and manufacturing.

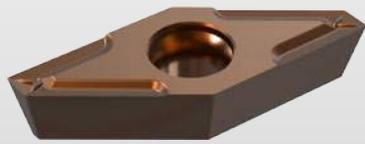

We have therefore taken the conscious decision to manufacture our “multidec®” own brand products in Switzerland. This puts us in a position to guarantee that all of our products fulfill the high UTILIS quality requirements.

In order to do this, in 2018 we set the course for the future with the completion of our extension building, among other things. This is the only way in which we can fulfill the high quality, precision and performance capability expectations of our customers.

We now have more than 80 employees at the Müllheim site, and are represented in more than 60 countries. This fills us with a great deal of pride, and compels and motivates us at the same time to always be a step ahead, also in the future.

INNOVATIONS IN THIS CATALOGUE

The revolutionary "TX+" coating

... for maximum productivity

... 122

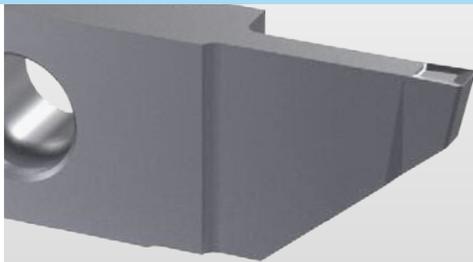

Bigger choice of ISO inserts

... for even more flexibility

... 172

Lasered chip breaker "GS12"

... for maximum chip control

Laser
GS12

... 109

Customer-specific special tools "multidec4you[®]"

... where standard tools approach the limits of their capability

... 600

Different information about multidec® application refer to certain machining methods. In addition, simple symbols inform of the product assortment and where additional products and technical information can be found.

Dimensions

All dimensions are in millimeter (mm); native dimensions in inch are calculated into millimeter.

Page information

□ 12... See page 12 and the following (example)

Recommended usage

- Preferred application
- Possible application
- Application not recommended

Availability

- Standard
- Semi-standard (by customer request)
- Standard New (in this catalog)
- Semi-standard (by customer request) New (in this catalog)
- discontinued

Important: The UHM30 carbide grade is being discontinued, and will be superseded by the new UHM20 grade.

Categorization of materials

The information on using multidec® tools refers to certain materials. The materials to be machined are categorized in the same color throughout the entire catalog:

Steel (non-alloyed, low alloyed and high alloyed)
Stainless steel
Titanium and Ti-alloys
Non-ferrous metals (gold, aluminum and brass)
Hard materials

Order designation

To the designation of the selected type of product, the desired cutting material code must be added. Supplementing information to the grades can be found according to the page references (□ ...).

Order designation		Carbide □ 20

Example: 1605-0.5-1.5 L UHM 20

Legend

Packaging information

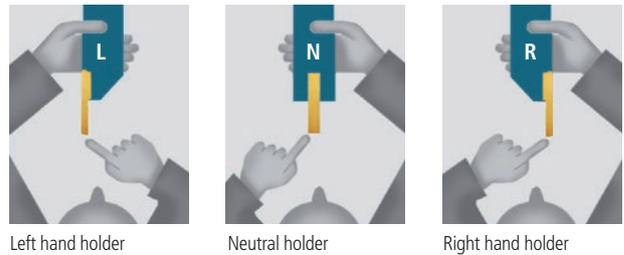

The product labels illustrate the content of the packaging and also show the materials on which the cutting insert can be used. For this purpose, UTILIS uses the ISO standard coding.

The UTILIS article number is generally also printed as a barcode on the UTILIS (multidec®) product packaging.

Execution of holder/insert

The side on which the insert is located determines whether it is a "left-" or "right-hand" holder. For this purpose, the holder is viewed with the insert pointing towards the observer.

Pictures

The right-hand version of the tools is usually shown. (Exceptions are possible). The tool colours illustrated here are not binding.

Product lines

To meet today's requirements of modern production it is not necessary to use the most accurate – but to use the tools adapted to the requirements. This means, the more accurate and sophisticated the process, the higher must be the accuracy of the produced tools. Therefore, the product range has been divided into three different accuracy classes. Your advantage: you buy the quality, which is effectively required.

Product line	Description
PREMIUM-LINE	The PREMIUM-LINE includes UTILIS tools with the highest accuracy requirements, especially for the production of micro parts. Tightest dimensional tolerances, precisely executed, highest surface quality and high repeatability are the features of this line. The manufacturing of these high-class tools requires considerable additional cost in production, which justifies the higher price of this product line.
STANDARD-LINE	The STANDARD-LINE meets the highest demands on the quality, which is demanded for Swiss type tools in production of small parts. Tight dimensional tolerances and high surface quality are implemented. These are quality standard tools, which are very well positioning this line in a wide range of applications.
VALUE-LINE	The VALUE-LINE is based on the known positions of our STANDARD-LINE. The most important functional elements – such as inserts and holders – are manufactured with the normal dimensional tolerances seen in the industry. Designed for the production of low-cost components, this line offers optimal quality standards. The greater tolerances and the reduced surface quality lower the production costs considerably, which also lowers the price in comparison to the standard product line.

Notes

10

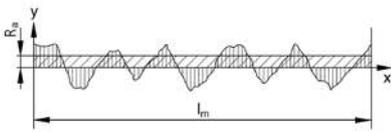

A series of horizontal lines for writing notes, spaced evenly down the page.

Surface quality	12
Improvement of feed rate by drag-cut with TOP System	13
Categorization of materials	14
Properties and application range of carbide, cermet and HSS (High Speed Steel)	20
Properties and application range for diamond	21
Properties and application range of coatings	23
Comparison of default hardness values	23
Causes and remedies of wear	24
Problems and their remedies in different cases	25
Working situations	26
Designation system (ISO)	28
Formulas	31

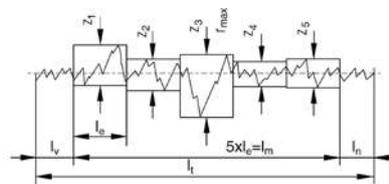

For the definition of surface roughness measured values are defined by DIN-ISO. In particular it means:

- Single surface roughness depth $Z_1 \dots Z_5$
This is the vertical distance between the highest and the lowest point of the roughness profile R within a single measured length l_e .
- Average roughness depth R_z (DIN 4768)
This is defined as the average value resulting from the single roughness depths of five successive single measured lengths l_e .
- Average roughness value R_a (DIN 4768)
This is defined as the arithmetical mean of the absolute sums of the roughness profile R within the entire measured length l_m .
- Max. surface roughness depth R_t (DIN 4768/1)
This is the distance between the elevation and depression of the line within the measured length (reference distance) of profile filtered according to DIN 4768 sheet 1.

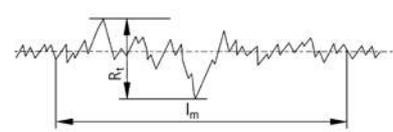

Average roughness value R_a

Single surface roughness depth Z

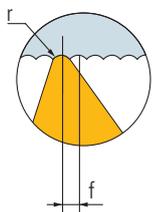

Maximum surface roughness R_t

Surface roughness by machining method

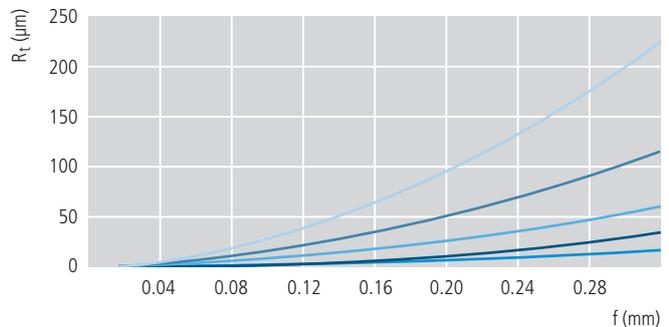

Surface roughness	Micro finishing ▼▼▼							Finishing ▼▼			Roughing ▼	
Surface symbol according to ISO 1302	0.025 ✓	0.05 ✓	0.1 ✓	0.2 ✓	0.4 ✓	0.8 ✓	1.6 ✓	3.2 ✓	6.3 ✓	12.5 ✓	25 ✓	50 ✓
Roughness index (former)	N1	N2	N3	N4	N5	N6	N7	N8	N9	N10	N11	N12
Average roughness value R_a (µm)	0.025	0.05	0.1	0.2	0.4	0.8	1.6	3.2	6.3	12.5	25	50
Surface roughness depth R_z (µm)	0.025	0.63	1	1.6	2.5	4-6.3	10	16-25	40	63	100	160

Theoretical surface roughness

r = Corner radius (mm)
 R_t = Theoretical surface roughness (µm)
 f = Feed (mm)

Standard design

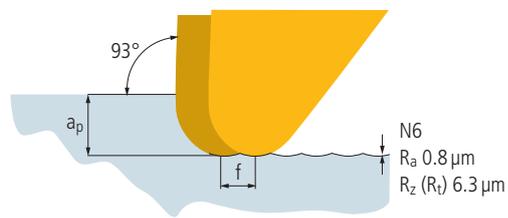

- $r = 0.05$ mm - $r = 0.10$ mm - $r = 0.20$ mm - $r = 0.40$ mm - $r = 0.80$ mm

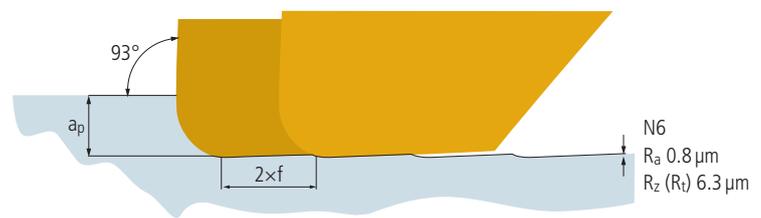

Improvement of feed rate by drag-cut with TOP System

By using the TOP system with drag-cut and a 93° holder the feed rate can be increased up to 2 times. This way the machining time can be decreased significantly by keeping the same quality. On the other hand within the same machining time the surface roughness can be improved clearly.

The following example illustrates the principle exactly.

Holder 93°
Corner radius 0.8 mm

Holder 93°
Corner radius 0.8 mm
multidec®-TOP insert

UCVD 08			-	-	-	-	-	-	●	●	●	-	
UPCD 15			-	-	-	-	-	-	●	●	-	-	
UPCD 20			-	-	-	-	-	-	●	●	○	-	

The exceptional hardness of diamonds in the various tool versions enables much higher cutting parameters to be achieved compared when conventional cutting materials are used.

In addition to traditional grinding and erosion machining, the use of high tech lasers not only produces top quality cutting edges, but also enables 3D chip removal geometries to be obtained.

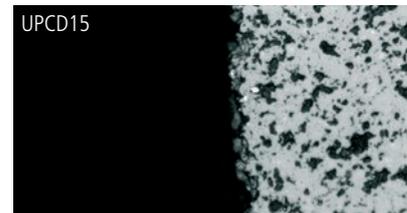

UPCD15 / UPCD20

UPCD (polycrystalline diamond) is a sintered diamond powder in a metallic bonding matrix. Its grain structure ranging from ultra-fine (UPCD20) to coarse (UPCD15) gives the UPCD varying degrees of toughness, so greatly extending the range of possible applications.

With its diamond content of around 90 % only, UPCD has a much lower hardness and hence wear-resistance than UCVD.

Suitable for the following materials:

- Aluminum with 8–20 % SiC
- Brass, copper and bronze
- Platinum and gold

UCVD08

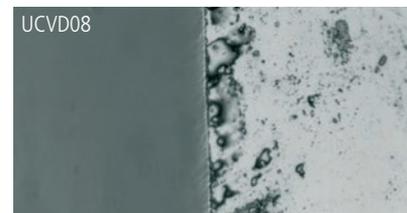

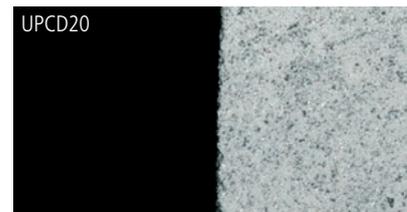

This diamond is produced by the CVD technique with a thickness of 0.8 mm. No binder is used. Minute diamond crystals are separated from the gas phase into a thick polymer diamond substrate which consists of up to 99.9 % diamond material.

Because of its high wear resistance, the life time of this innovative cutting material is between 2 and 10 times longer than that of UPCD.

The extremely sharp cutting edge enables reduced cutting pressure to be applied, therefore achieving excellent surface quality.

Suitable for the following materials:

- CFK... up to 80 % carbon fiber
- GFK... up to 80 % glass fiber
- Plastics
- Aluminum with 8–20 % SiC
- Brass, copper and bronze
- Platinum and gold

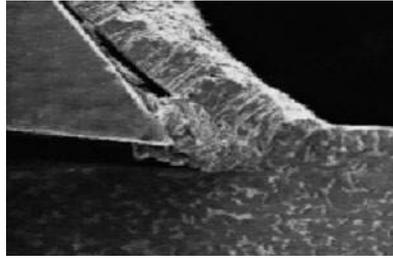

Properties and application range of coatings

Standard for general applications												
HX	TiAIN / AlTiN	●	●	●	●	●	●	●	●	○	-	Standard allround coating for finishing and micro-finishing operations on a wide range of materials.
HPX	TiAIN / AlTiN	●	●	●	●	●	●	○	○	○	-	
MZ	TiN / TiAIN	●	●	●	●	●	-	-	-	-	-	
INNOVATION	TX+	TiSiN	-	○	●	●	●	-	-	-	●	High-performance coating for micro finishing and finishing operations in steel, stainless steel and highly heat resistant materials as well as micro cutting of hardened steels up to 70 HRC.
		<p>A new coating technology gave rise to this high-performance hard material coating. This coating is characterised by its extremely smooth, defect-free finish and the extreme hardness and adhesion. Its even, micro-accurate and thin coating provides maximum cutting edge quality, even with the smallest tools. It counteracts the formation of built-up edges during deployment, and provides improved chip flow. The surface quality and the tool life increase significantly. This coating has now been introduced as the standard coating in all multidec® product lines.</p>										
General applications (upon customer request)												
SX	TiN	●	●	○	○	○	-	○	○	-	-	Coating for the machining of steel materials for slow and medium cutting speeds. Not recommended for highly heat resistant materials.
BX	TiCN	●	●	○	●	○	○	-	-	-	-	Coating with extreme hardness and outstanding toughness. Extremely suitable for steel, stainless steel and conditionally for titanium, at slow cutting speeds.
HX-A	AlCrN	●	●	●	●	●	○	-	-	-	-	Universally usable coating for dry and wet machining at fast cutting speeds in steel and stainless steel.
Special applications (upon customer request)												
HX-F	AlCrN	●	●	●	●	●	○	-	-	-	-	High-performance coating for micro finishing operations in steel and stainless steel. Recommended for sharp edges, which are used in micro machining.
DX-T	Diamond DLC	-	-	-	-	-	-	●	●	○	-	Diamond coating for non-ferrous metals. Recommended for aluminium, plastic, brass and copper.
DX-HC	Diamond Ta-C	-	-	-	-	-	-	●	●	●	-	High performance diamond coating for non-ferrous metals. Recommended for aluminium alloys, platinum, silver, gold, composites and reinforced synthetics

Properties and application range of coatings

With the refinement of cutting tools with an additional coating the wear will be decisively reduced. Rubbing, warming up, diffusion and oxidation decreases significantly.

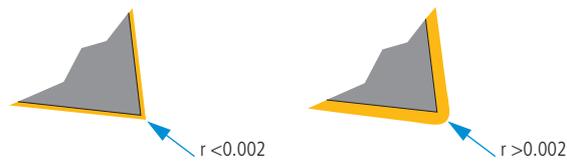

Cutting process without coated tool

Cutting process with coated tool

Rounded edges among coated inserts

Every coating of a carbide insert results in rounded cutting edge. The smaller the diameter of the material to be cut, the more significant are the consequences in the cutting performance. Therefore the rounding off of the cutting edge depends on the thickness of the coated layer. As thicker the coating, as greater is the radius created along the cutting edge.

A Flank wear

Reasons:

- Cutting speed too high
- Carbide grade with too little wear resistance
- Feed rate not adapted

Remedies:

- Reduce cutting speed
- Select better wear resistant carbide grade
- Adapt feed rate to cutting speed and cutting depth (increase feed rate)

Abrasion on flank, normal wear after a certain machining time.

B Edge chipping

Reasons:

- Grade with too high wear resistance
- Vibrations
- Feed rate too high or excessive cutting depth
- Interrupted cut
- Swarf damage

Remedies:

- Use tougher carbide grade
- Use negative cutting edge geometry with chip groove
- Increase stability (tool and work piece)

Through excessive mechanical stress at the cutting edge fracture and chipping can take place.

C Cratering

Reasons:

- Too high cutting speed and/or feed rate
- Rake angle too shallow
- Carbide grade with little wear resistance
- Insufficient coolant supply

Remedies:

- Reduce cutting speed and/or feed rate
- Increase coolant quantity and/or pressure, optimize coolant supply
- Use carbide grade which is more resistant to cratering

The hot chip which is being evacuated causes cratering at the rake face of the cutting edge.

D Plastic deformation

Reasons:

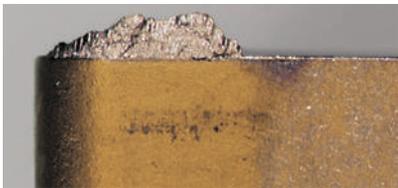

- Too high machining temperature, resulting in softening of substrate
- Damaged coatings

Remedies:

- Reduce cutting speed
- Choose carbide grade with higher wear resistance
- Provide cooling

High machining temperature and simultaneous mechanical stress can lead to plastic deformation.

E Built-up edges

Reasons:

- Too low cutting speed
- Too small rake angle
- Wrong cutting material
- Lack of cooling/lubrication

Remedies:

- Increase cutting speed
- Enlarge rake angle
- Select more resistant coating
- Use emulsion with higher concentration

Built-up material/edges occur when the chip is not evacuated properly due to a too low cutting temperature.

F Insert breakage

Reasons:

- Excessive stress of cutting material
- Lack of stability
- Corner angle too small
- Excessive notching

Remedies:

- Use tougher carbide grade
- Use protective edge chamfer
- Increase honing of cutting edge
- Use more stable geometry

Excessive stress of the insert causes breakage.

🔍 inspect, optimise

The cutting temperature particularly the wear depends significantly on the cutting conditions (v_c , f and a_p). Thermal causes of wear like oxidation and diffusion increase disproportionately.

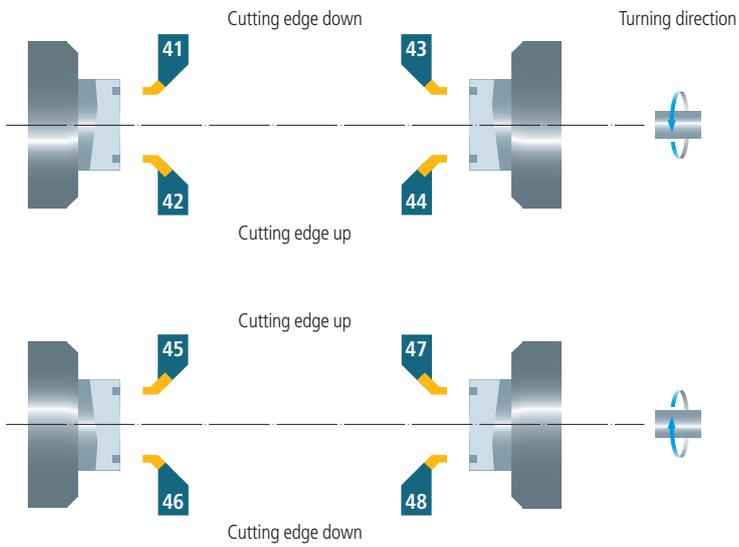

With the illustration below it is possible to achieve up different tooling situations. Choose yours and we will recommend you the suitable tooling solution.

$$v_c = \frac{d_1 \cdot \pi \cdot n}{1000} \text{ [m/min]}$$

Revolutions per minute (n)

$$n = \frac{v_c \cdot 1000}{d_1 \cdot \pi} \text{ [min}^{-1}\text{]}$$

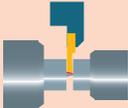

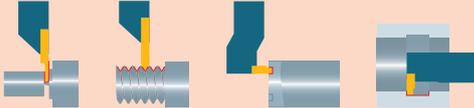

Feedrate (v_f)

$$v_f = f \cdot n \text{ [mm/min]}$$

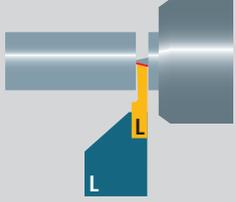

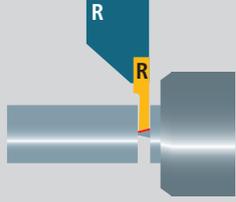

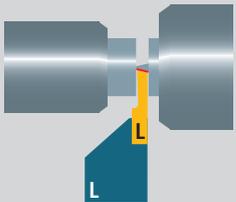

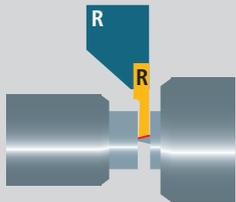

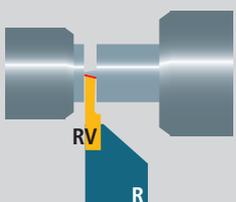

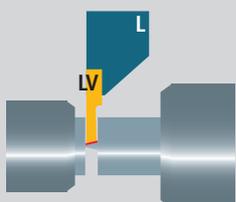

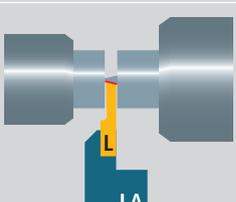

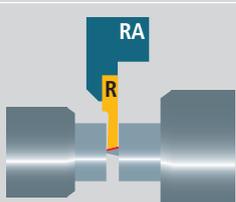

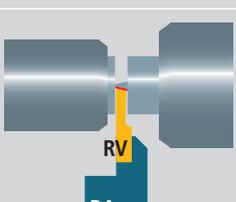

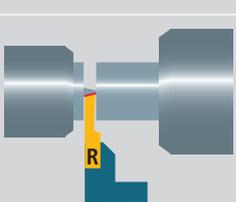

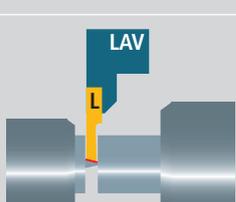

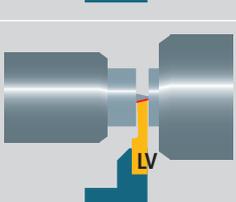

multidec®-CUT is most commonly used in OD-turning or alternatively in ID-turning. 5 systems are distinguished by the cutting depth or width and application field of machining process. All inserts are replaceable very easy and known for its great repeat accuracy. For cutting of all common materials we offer ideal adjusted micrograin carbides grades (K10–K40 PVD coated and uncoated).

The designation of every insert and holder includes all important information according to the following system:

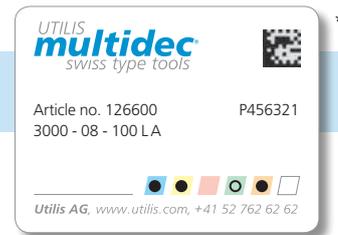

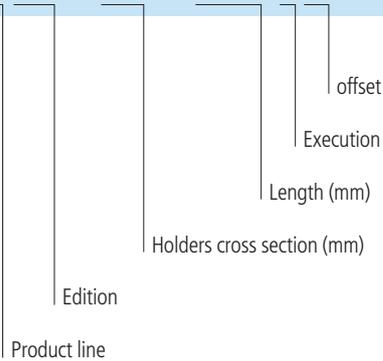

Inserts

3002 - 1.5 - 8L SC UHM20 HX

Holders

3000 - 08 - 100 LA

* Packaging Information 8

The turn and cut-off system 500 is suitable for Swiss type cam lathes up to bar diameter 15mm. The neutral cutting inserts, only available as blanks, consist of one cutting edge and will be mounted on tool holders with a repeatability of <math><0.01\text{ mm}</math>. Even for the ground, hardened and nickel plated holders a wide range of possibilities with shank sizes between 6 and 10 mm are available. For Swiss-type automatic lathes special holders have been designed and complete the wide range of choices.

Advantages:

- Replace brazed tools on cam machines
- Neutral inserts with mirror polished cutting face
- Coated and uncoated blanks available
- The machine operator can grind his own cutting geometries

Legend □8...

The turn and cut-off system 1600 is suitable for Swiss type lathes up to bar diameter 10 mm. The cutting inserts consist of two cutting edges. Even for the holders a wide range of possibilities with shank sizes between 7 and 25 mm are available. For Swiss-type automatic lathes special holders have been designed and complete the wide range of choices.

Advantages:

- Large selection of cutting geometries with different chip breakers especially made for smallest parts
- Full profile threading inserts starting from M 0.2 (0.06 mm pitch)
- Grooving inserts width starting from 0.05 mm

"IC" tool holder with integrated cooling

Cost-efficient processing of modern materials increasingly requires accurate control of the coolant at the cutting edge. Conveying the coolant as close as possible to the cutting edge is often a difficult task in the machine rooms of Swiss type turning lathes.

The multidec®-IC program offers a wide range of holders with integrated cooling. Because of the high precision and pressure, it is possible to discharge the chip quickly and safely from the cutting edge and the workpiece, which protects the cutting edge of the insert. This means significantly longer tool life as well as very reliable serial production.

Advantages:

- All holders feature five possible connectors for the coolant supply
- Fixed coolant exit allows for small set-up in front of the holder
- With or without high pressure, the coolant medium always hits the cutting edge precisely

"TWIN" holder with and without integrated coolant supply

The "TWIN" range allows you to work with two inserts on the same holder.

Different combinations are possible, and provide the user with a high degree of flexibility. Holders are available with shank cross-sections of 8 to 20 mm, with and without internal cooling.

Advantages:

- Twice the number of tools on the machine
- Two different turning operations are possible with a single tool holder
- All holders with an integrated coolant supply have five connecting options

"Y-AXIS" holder with and without integrated coolant supply

Y-AXIS holders solve the chip control problems that can occur when cutting long-chip materials. With the Y-AXIS holder, the cutting edge is offset by 90° compared to the standard holder, whereby the chips fall in the bed of the machine. This prevents troublesome tumbling and flowing chips that can become caught on the cutting edge and damage it.

Benefits:

- Suitable for long chipping materials
- The problem of chip control is solved
- Holders with internal cooling
- All holders feature five possible connectors for the coolant supply

Usage notes:

To avoid problems, two Y-AXIS holders must not be mounted directly next to each other. Mount a standard tool holder between the Y-AXIS holders.

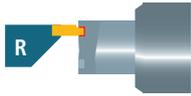

To prevent collisions, move back the holder in accordance with the overhanging length before changing the tool position.

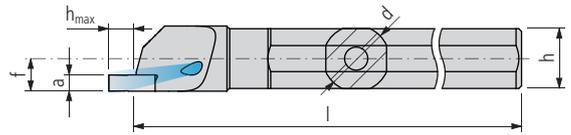

$$d_{max} = \frac{(z_1 - z_2)^2 + x_1^2}{x_1}$$

Scope of delivery: Holder without coolant connector

Legend □ 8...

The turning system 1700 ideally complements the existing system 1600. The inclined position of the insert in the holder enables the tool to pass close to complex shapes with no risk of collision. The inserts consist of two cutting edges. Even for the holders a wide range of possibilities with shank sizes between 8 and 20 mm are available. For Swiss-type automatic lathes special holders have been designed and complete the wide range of choices.

Advantages:

- Tool holder clearance given from insert seat
- Grooving inserts width starting from 0.05 mm
- "WCT" threading program for turning NIHS 60–30 threads in watch cases

TORX screwdriver 651...

A turn and cut-off tool system for Swiss type lathes up to bar diameter 32 mm. The cutting inserts consist of two cutting edges. The insert seat, which is protected against contamination permits 100 % utilization of all cutting edges.

Even for the holders a wide range of possibilities with shank sizes between 8 and 25 mm are available. For Swiss-type automatic lathes special holders have been designed and complete the wide range of choices.

Advantages:

- Large selection of insert geometries with different chip breaker geometries
- Special chip breaker design for machining of small to mid-sized work pieces
- Perpendicularity guaranteed by two fixing screws, large support face and a genuine stop face for axial positioning
- The cutting forces are transferred directly from the insert to the holder
- 2nd edge still usable after the first has crashed

"IC" tool holder with integrated cooling

Cost-efficient processing of modern materials increasingly requires accurate control of the coolant at the cutting edge. Conveying the coolant as close as possible to the cutting edge is often a difficult task in the machine rooms of Swiss type turning lathes.

The multidec®-IC program offers a wide range of holders with integrated cooling. Because of the high precision and pressure, it is possible to discharge the chip quickly and safely from the cutting edge and the workpiece, which protects the cutting edge of the insert. This means significantly longer tool life as well as very reliable serial production.

Advantages:

- All holders feature five possible connectors for the coolant supply
- Fixed coolant exit allows for small set-up in front of the holder
- With or without high pressure, the coolant medium always hits the cutting edge precisely

"AK" holder with integrated coolant supply for machines with a revolving turret

The AK holder is ideally suitable for using the inserts of the multidec®-CUT 3000 system on lathes with a revolving turret. There are two fixed coolant outlets in the offset head section. A coolant connection with a G $\frac{1}{8}$ " thread is attached to the front on the outside. There are three other M5 connections on the top, bottom and side of the holder which can be used for supplying the coolant directly, provided that the turret is appropriately designed.

Advantages:

- Use of multidec®-CUT 3000 cutting edges on machines with a revolving turret
- Several connection/delivery options for the integrated cooling
- The coolant always lands on the cutting edge precisely, with or without high pressure

Lasered chip breaker "GS12"

Perfect chip control is an important factor in modern production nowadays. This can be achieved using the newly developed neutral cut-off insert "GS12", which is manufactured using state-of-the-art laser technology.

Advantages:

- Better chip control and therefore more process reliability.
- Wear-resistant and hard metal substrate with coating
- Sharp cutting edges
- Can be used on all holders of the multidec®-CUT 3000 series

Laser GS12

Chip breaker "GS"

This insert with the chip breaker "GS" was developed using a revolutionary new manufacturing technology. Geometry, carbide and coating are perfectly matched to cut off all materials.

Advantages:

- Optimally tuned carbide and coating for high cutting speeds
- Good chip control by special chip breaker
- Rounded cutting edge "E" for steel and easily machineable stainless steel
- Sharp cutting edge "F" for super-alloys, non-ferrous metals and stainless steels which are difficult to machine
- Can be used on all holders of the multidec®-CUT 3000 series

Clamping of the insert on holder 3000... C □ 157

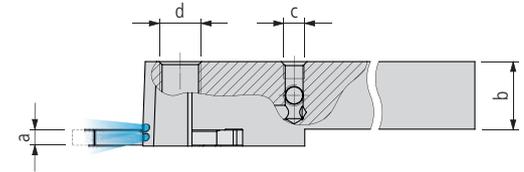

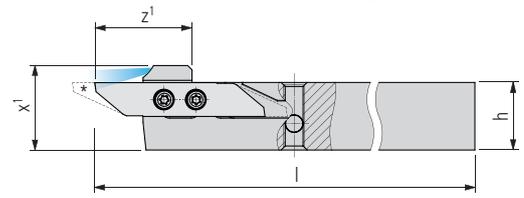

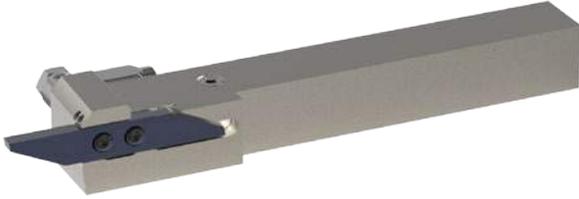

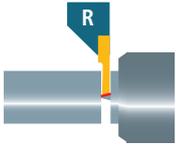

The regular tool holder multidec®-CUT 3000 uses the insert fixing screws from the side of the insert. The tool holder CUT 3000 C "Combi" allows in addition the insert fixing screws to be mounted from the opposite side using tapped bushings.

To avoid damage don't use excessive force while inserting and removing the tapped bushing.

With off-set shank for machines with a revolving turret

C: Combi; A: offset shank

* Holder up to shank width of 8 mm

** Holder from shank width of 10 mm

TORX screwdriver 651...

A turn and cut-off tool for Swiss type lathes up to bar diameter 20 mm. The cutting inserts consist of two cutting edges. The insert seat, which is protected against contamination permits 100 % utilization of all cutting edges.

Even for holders a wide range of possibilities with shank sizes between 8 and 25 mm are available. For Swiss type automatic lathes special holders have been designed and complete the wide range of choices.

Advantages:

- System for grooving large and wide forms up to 6 mm
- The machine operator can grind his own cutting geometries

“IC” tool holder with integrated cooling

Cost-efficient processing of modern materials increasingly requires accurate control of the coolant at the cutting edge. Conveying the coolant as close as possible to the cutting edge is often a difficult task in the machine rooms of Swiss type turning lathes.

The multidec®-IC program offers a wide range of holders with integrated cooling. Because of the high precision and pressure, it is possible to discharge the chip quickly and safely from the cutting edge and the workpiece, which protects the cutting edge of the insert. This means significantly longer tool life as well as very reliable serial production.

Advantages:

- All holders feature five possible connectors for the coolant supply
- Fixed coolant exit allows for small set-up in front of the holder
- With or without high pressure, the coolant medium always hits the cutting edge precisely

Properties and applications

170

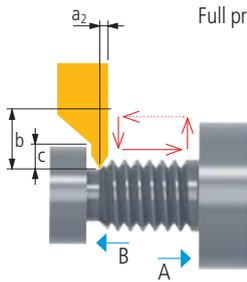

Full profile threading inserts 1606... VP / 3006... VP up to pitch of 0.45 mm

Properties:

- Insert front side ground far back (b)
- At a minimum reduced distance between the thread tip and front side (a_2)

This makes it possible to move extremely close to the shoulder (A) with an extremely narrow or non-existent undercut.

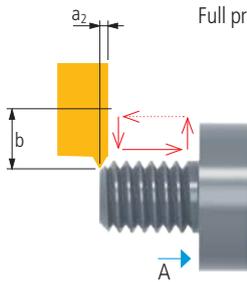

Full profile threading inserts 1606... VP / 3006... VP from pitch of 0.5 mm

Properties:

- Insert front side ground far back (b)
- At a minimum reduced distance between the thread tip and front side (a_2)
- Back of insert ground free towards the rear (c)

This makes it possible to move extremely close to the shoulder (A) with an extremely narrow or non-existent undercut. This version also makes it possible to manufacture a thread behind a shoulder (B).

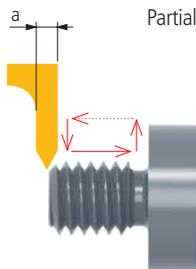

Full profile threading inserts, reinforced 3006... VP – from pitch of 0.25 mm

Properties:

- Insert front side ground far back (b)
- At a minimum reduced distance between the thread tip and front side (a_2)
- Reinforcement of the threading profile using a special cut

The reinforcement makes it possible to reduce the number of passes by up to 20 %. It is possible to move extremely close to the shoulder (A) with an extremely narrow or non-existent undercut.

Partial profile threading inserts 1606... / 3006... with pitch of 0.25–2 mm

Properties:

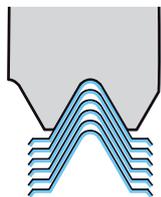

- Front of insert with wide partial profile cut (a) for covering a bigger pitch area

This makes it possible to manufacture various pitches with the same indexable insert, but requires an undercut for smaller pitches.

Number of passes

Hard materials		3–6	4–7	5–8	6–9	8–10	9–12	10–15	11–17	13–20	18–22	20–26	25–30

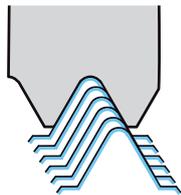

Choice of feed movement

Radial feed

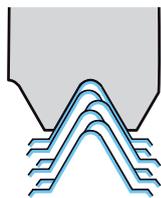

Applicability:
 – for conventional lathes
 – for piches < 2 mm
 – short chipping materials

Disadvantage:
 – poor chip control

Feed on the flanks

Applicability:
 – for CNC lathes
 – for piches 2 to 4 mm
 – long chipping materials
 – good chip control

Alternated feed

Applicability:
 – for piches > 4 mm
 – long chipping materials
 – regular wear of insert
 – high tool-life
 – good chip control

Disadvantage:
 – complex CNC-programming

multidec®-ISO provides a very wide range of ISO standardized inserts for Swiss type machining and precision turning. All inserts consist of two or more edges and are easily indexed or changed. All inserts have several cutting edges and are easily replaceable. At the same time, multidec®-ISO provides sharp and rounded cutting edges with radii between 0 and 0.8 mm. Innovative solutions involving coated and uncoated inserts made of carbide, cermets and diamond tips have been designed to cut very difficult materials. For all mechanical cutting conditions a large choice of sintered and ground inserts with a wide variety of chip grooves are available. Even for the holders a wide range of possibilities with shank sizes between 8 and 25 mm are available. For Swiss type automatic lathes special holders have been designed and complete the wide range of choices.

Advantages:

- Large range of standard ISO inserts
- Sharp cutting edges "F"
- Rounded cutting edges "E"
- Small corner radius (0–0.8 mm)
- Especially designed holders for CNC Swiss type automatic lathes (sizes 8×8 to 25×25 mm)

The versatility of the materials which are machined in a modern production facility requires suitable chip breakers and also a wider variety of cutting edge types, carbide grades and coatings. Our range of ISO inserts has been supplemented with the introduction of the new "PF05" insert and the addition of cutting geometries "A3", "PF23" and "PF33".

New chip breaker for materials with difficult chip breaking behaviour

FN-PF05

Precision grinding with ISO-E tolerance at the centre height and at the inner circle, together with an extremely wear-resistant substrate and modern coating, make this insert a real problem-solver for the machining of stainless steels and super-alloys.

Advantages:

- High insert change repeat accuracy
- Sharp cutting edge despite coating

New versions of existing inserts

**EN-A3
FN-A3**

EN-... : With rounded cutting edge "E"
FN-... : With sharp cutting edge "F"

**EN-PF23
FN-PF23**

The proven chip breakers A3, PF23 and PF33 are now also available with a slightly rounded cutting edge. New carbide grades and a new high performance coating have also been introduced for all of these inserts.

This wide range of options will increase your flexibility in choosing the right cutting edge tremendously, and provide a suitable solution for all materials.

Advantages:

- A much wider range of workpieces can be processed.
- Bigger feeds and cutting depths are possible with rounded cutting edges
- Substrates that are both wear-resistant and extremely tough are available.
- Optimally coordinated coatings for high performance.

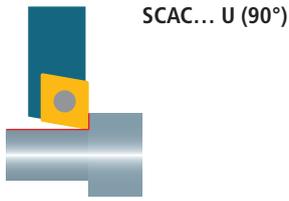

**EN-PF33
FN-PF33**

Inserts 177/201/249/259

All illustrations show right hand design. Left hand design is also available.

multidec®-ISO provides a well balanced range of tools for turning with rhombic 80° inserts and holders. Positive inserts with rounded cutting edges for roughing and sharp cutting edges for finishing are available.

These include a wide range of ground holders with hardened and nickel-plated surfaces for Swiss type automatic lathes with shank sizes from 8 to 20 mm and boring bars with diameters from 8 to 20 mm.

Advantages:

- High cutting volume with high feed rates
- Carbide and Cermet grades with chip breaker and coatings for all common materials
- Diamond range with CVD and PCD inserts for machining non-ferrous metals
- Cutting edge radius from 0.03 to 0.8 mm as standard
- Boring bars with steel- and carbide shank

"IC" tool holder with integrated cooling

Cost-efficient processing of modern materials increasingly requires accurate control of the coolant at the cutting edge. Conveying the coolant as close as possible to the cutting edge is often a difficult task in the machine rooms of Swiss type turning lathes.

The multidec®-IC program offers a wide range of holders with integrated cooling. Because of the high precision and pressure, it is possible to discharge the chip quickly and safely from the cutting edge and the workpiece, which protects the cutting edge of the insert. This means significantly longer tool life as well as very reliable serial production.

Advantages:

- All holders feature five possible connectors for the coolant supply
- Constant coolant discharge means low build-up at front near the holder
- With or without high pressure, the coolant medium always hits the cutting edge precisely

Application range of chip breaker

Properties:

- high precision sintered insert
- rounded cutting edge "E"
- micrograin carbide, heat and wear resistant
- best performance-cost ratio

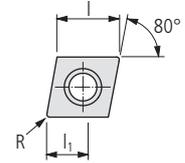

Optimal chip breaking

Application:

- finishing
- chip breaker for soft materials with good chip control
- alloyed steel, stainless steel, super alloy, titanium and aluminum

CCGT ... -PF

Application:

- micro finishing for unstable or thin-walled parts
- chip breaker for materials with difficult chip control
- synthetics reinforced/composites, aluminum, platinum, gold and synthetics
- ideal for smallest tolerance and medium surface quality

multidec®-ISO provides a well balanced range of tools for turning with rhombic 55° inserts and holders. Positive inserts with rounded cutting edges for roughing and sharp cutting edges for finishing are available.

These include a wide range of ground holders with hardened and nickel-plated surfaces for Swiss type automatic lathes with shank sizes from 8 to 20 mm and boring bars with diameters from 10 to 20 mm.

Advantages:

- Carbide and Cermet grades with chip breaker and coatings for all common materials
- Diamond range with CVD and PCD inserts for machining non-ferrous metals
- Cutting edge radius from 0.03 to 0.8 mm as standard
- Boring bars with steel- and carbide shanks

"IC" tool holder with integrated cooling

Cost-efficient processing of modern materials increasingly requires accurate control of the coolant at the cutting edge. Conveying the coolant as close as possible to the cutting edge is often a difficult task in the machine rooms of Swiss type turning lathes.

The multidec®-IC program offers a wide range of holders with integrated cooling. Because of the high precision and pressure, it is possible to discharge the chip quickly and safely from the cutting edge and the workpiece, which protects the cutting edge of the insert. This means significantly longer tool life as well as very reliable serial production.

Advantages:

- All holders feature five possible connectors for the coolant supply
- Constant coolant discharge means low build-up at front near the holder
- With or without high pressure, the coolant medium always hits the cutting edge precisely

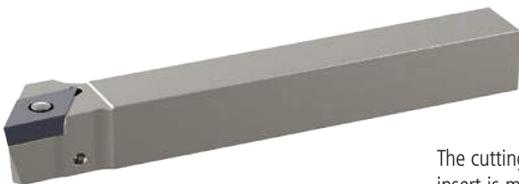

"TWIN" holder with and without integrated coolant supply

The "TWIN" range allows you to work with two inserts on the same holder. Different combinations are possible, and provide the user with a high degree of flexibility. Holders are available with shank cross-sections of 8 to 20 mm, with and without internal cooling.

Advantages:

- Twice the number of tools on the machine
- Two different turning operations are possible with a single tool holder
- All holders with an integrated coolant supply have five connecting options

"FC" holder with quick cutting edge change system (fast change)

The cutting edge can be changed without unclamping the holder using the "FC" holder. The indexable insert is mounted using a specially developed knee lever which is operated using a clamping screw on the rear of the holder.

Advantages:

- Quick indexable insert change directly in the machine
- Holder with and without integrated coolant supply

* Description TOP □ 13

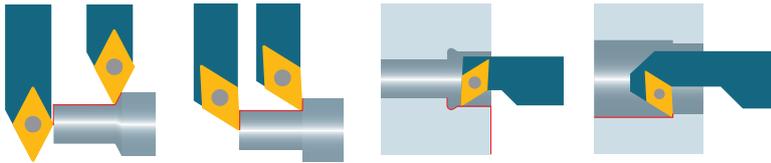

Application range of chip breaker

- Properties:**
- polished rake and ground clearance
 - sharp cutting edge "F"
 - micrograin carbide, heat and wear resistant
 - TOP system, for a better surface finish

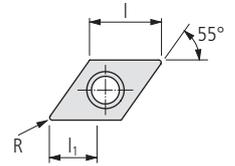

Optimal chip breaking

- Application:**
- finishing for 20-100 % higher feed rates compared to the standard
 - chip breaker for materials with difficult chip control
 - stainless steel, alloyed steel, titanium, super alloy, aluminum and synthetics reinforced/composites

Application range of chip breaker

Properties:

- polished rake
- ground clearance
- little rounded cutting edge "E"
- micrograin carbide

Optimal chip breaking

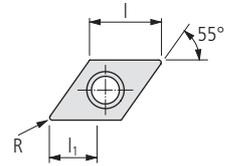

Application:

- finishing
- chip breaker for materials with difficult chip control
- alloyed steel and stainless steel

Spare parts (clamping bolts /screws) □ 247

* Note

With this holder, the indexable insert is secured with a screw using a knee lever that can be operated from behind. This means the holder does not have to be unclamped to change the cutting edge.
 Tighten the clamping screw to 1.2 Nm using a torque screwdriver.

This further development of multidec®-ISO provides a tool system with 4 cutting edges and the finest performance-cost ratio for Swiss type machining and precision turning. The insert consist of 4 sharp cutting edges with radius 0.08 and 0.15 mm and is easily indexed or changed. Innovative chip breakers have been designed for cutting of very difficult materials on finishing and micro-finishing applications using coated and uncoated submicrograin carbide. Even for the hardened and nickel-plated holders a wide range of possibilities with shank sizes between 10 and 25 mm are available. For Swiss type automatic lathes special holders have been designed and complete the range of choices.

Specific features of insert DNGU:

- Negative holder fixed with screw
- 4 positive cutting edges for the price of 2
- Sharp edges with 7° clearance angle
- Small corner radius (0.08 and 0.15 mm)
- Fine grain grade carbide
- Insert DNGU also usable on holders with toggle setting device

"IC" tool holder with integrated cooling

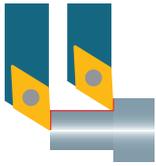

Cost-efficient processing of modern materials increasingly requires accurate control of the coolant at the cutting edge. Conveying the coolant as close as possible to the cutting edge is often a difficult task in the machine rooms of Swiss type turning lathes. The multidec®-IC program offers a wide range of holders with integrated cooling. Because of the high precision and pressure, it is possible to discharge the chip quickly and safely from the cutting edge and the workpiece, which protects the cutting edge of the insert. This means significantly longer tool life as well as very reliable serial production.

Advantages:

- All holders feature five possible connectors for the coolant supply
- Constant coolant discharge means low build-up at front near the holder
- With or without high pressure, the coolant medium always hits the cutting edge precisely

Application range of chip breaker

Properties:

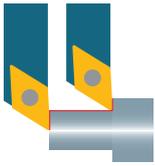

- polished rake and ground clearance
- 4 sharp cutting edge "F"
- submicrograin carbide, high toughness
- best performance-cost ratio

Optimal chip breaking

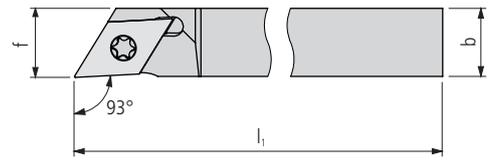

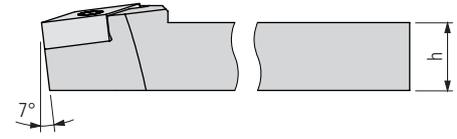

Application:

- micro finishing
- chip breaker for general application
- alloyed steel and stainless steel

Lined area for notes.

multidec®-ISO provides a well balanced range of tools for turning with rhombic 35° inserts and holders. Positive inserts with rounded cutting edges for roughing and sharp cutting edges for finishing are available.

These include a wide range of ground holders with hardened and nickel-plated surfaces for Swiss type automatic lathes with shank sizes from 8 to 20 mm and boring bars with diameters from 12 to 20 mm.

Advantages:

- Carbide and Cermet grades with chip breaker and coatings for all common materials
- Diamond range with CVD and PCD inserts for machining non-ferrous metals
- Cutting edge radius from 0.05 to 0.8 mm as standard
- Boring bars with steel- and carbide shanks

"IC" tool holder with integrated cooling

Cost-efficient processing of modern materials increasingly requires accurate control of the coolant at the cutting edge. Conveying the coolant as close as possible to the cutting edge is often a difficult task in the machine rooms of Swiss type turning lathes.

The multidec®-IC program offers a wide range of holders with integrated cooling. Because of the high precision and pressure, it is possible to discharge the chip quickly and safely from the cutting edge and the workpiece, which protects the cutting edge of the insert. This means significantly longer tool life as well as very reliable serial production.

Advantages:

- All holders feature five possible connectors for the coolant supply
- Constant coolant discharge means low build-up at front near the holder
- With or without high pressure, the coolant medium always hits the cutting edge precisely

"TWIN" holder with and without integrated coolant supply

The "TWIN" range allows you to work with two inserts on the same holder. Different combinations are possible, and provide the user with a high degree of flexibility. Holders are available with shank cross-sections of 8 to 20 mm, with and without internal cooling.

Advantages:

- Twice the number of tools on the machine
- Two different turning operations are possible with a single tool holder
- All holders with an integrated coolant supply have five connecting options

Application range of chip breaker

Properties:

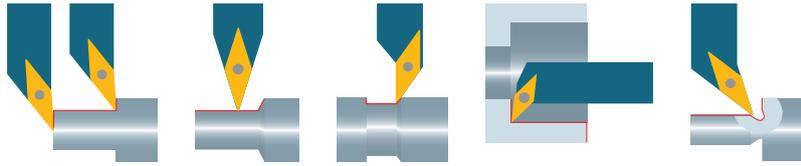

- polished rake
- ground clearance
- sharp cutting edge "F"
- submicrograin carbide, heat and wear resistant

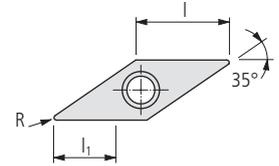

Optimal chip breaking

Application:

- micro finishing
- chip breaker for general application
- stainless steel, alloyed steel, titanium, super alloy, aluminum and synthetics reinforced/composites

* Description TOP 13

Application range of chip breaker

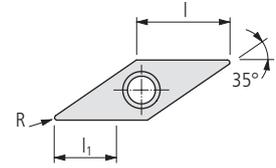

- Properties:**
- polished rake and ground clearance
 - sharp cutting edge "F"
 - micrograin carbide, heat and wear resistant
 - TOP system, for a better surface finish

- Application:**
- finishing for 20–100 % higher feed rates compared to the standard
 - chip breaker for materials with difficult chip control
 - stainless steel, alloyed steel, titanium, super alloy, aluminum and synthetics reinforced/composites

Application range of chip breaker

Properties:

- polished rake
- ground clearance
- sharp cutting edge "F"
- micrograin carbide

Optimal chip breaking

Application:

- micro finishing
- chip breaker for materials with difficult chip control
- alloyed steel and stainless steel

Feed (f) and depths of cut (a_p) 178...

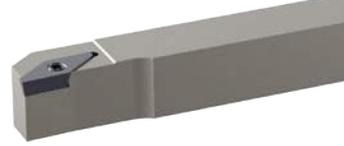

The "TOP" system with drag-cut permits an increase of the feed rate of up to 100 % compared to conventional ISO inserts.

- The VPGT 1003... F provides a sharp cutting edge for semi-finishing, finishing and micro-finishing.
- The VPET 1003... F provides a sharp cutting edge and the tolerance of its insert height is more precise. This is an advantage as the height does not have to be reset when changing the insert.
- The VPXT 1003... E is a directly pressed insert with rounded cutting edge for roughing and semi-finishing.

Advantages:

- Front turning, back turning and facing with one insert
- Carbide grades and coatings for steel, stainless steel and superalloys
- Cutting edge radius from 0 to 0.35 mm available as standard
- Heat-treated holders and boring bars
- Reinforced "V" type holders for front turning with high depths of cut

"IC" tool holder with integrated cooling

Cost-efficient processing of modern materials increasingly requires accurate control of the coolant at the cutting edge. Conveying the coolant as close as possible to the cutting edge is often a difficult task in the machine rooms of Swiss type turning lathes.

The multidec®-IC program offers a wide range of holders with integrated cooling. Because of the high precision and pressure, it is possible to discharge the chip quickly and safely from the cutting edge and the workpiece, which protects the cutting edge of the insert. This means significantly longer tool life as well as very reliable serial production.

Advantages:

- All holders feature five possible connectors for the coolant supply
- Constant coolant discharge means low build-up at front near the holder
- With or without high pressure, the coolant medium always hits the cutting edge precisely

"TWIN" holder with and without integrated coolant supply

The "TWIN" range allows you to work with two inserts on the same holder. Different combinations are possible, and provide the user with a high degree of flexibility. Holders are available with shank cross-sections of 8 to 20 mm, with and without internal cooling.

Advantages:

- Twice the number of tools on the machine
- Two different turning operations are possible with a single tool holder
- All holders with an integrated coolant supply have five connecting options

"Y-AXIS" holder with and without integrated coolant supply

Y-AXIS holders solve the chip control problems that can occur when cutting long-chip materials. With the Y-AXIS holder, the cutting edge is offset by 90° compared to the standard holder, whereby the chips fall in the bed of the machine. This prevents troublesome tumbling and flowing chips that can become caught on the cutting edge and damage it.

Benefits:

- Suitable for long chipping materials
- The problem of chip control is solved
- Holders with internal cooling
- All holders feature five possible connectors for the coolant supply

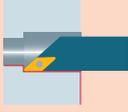

"FC" holder with quick cutting edge change system (fast change)

The cutting edge can be changed without unclamping the holder using the "FC" holder. The indexable insert is mounted using a specially developed knee lever which is operated using a clamping screw on the rear of the holder.

Advantages:

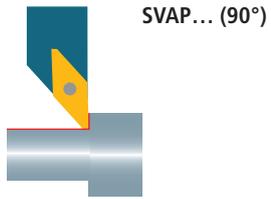

- Quick indexable insert change directly in the machine
- Holder with and without integrated coolant supply

* Description TOP □ 13

Application range of chip breaker

Properties:

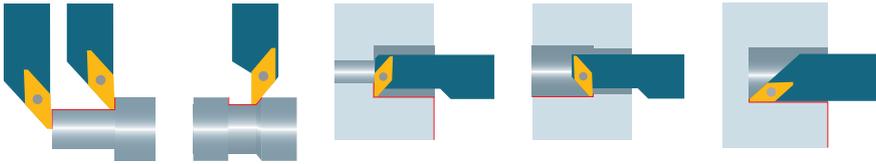

- polished rake and ground clearance
- sharp cutting edge "F"
- submicrograin carbide, high toughness
- TOP system, for a better surface finish
- closer tolerance "E"

Optimal chip breaking

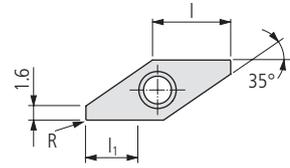

Application:

- finishing for 20-100 % higher feed rates compared to the standard
- chip breaker for general application
- stainless steel, alloyed steel and super alloy

Spare parts (clamping bolts/screws) □ 331

* Note

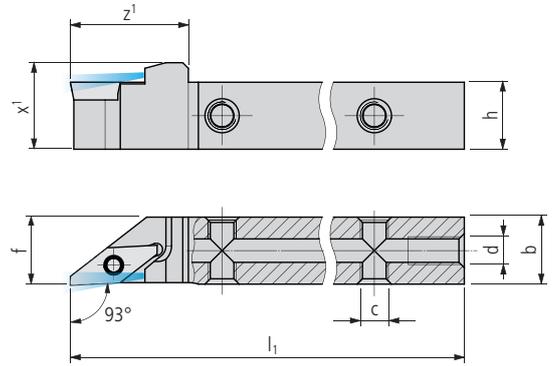

With this holder, the indexable insert is secured with a screw using a knee lever that can be operated from behind. This means the holder does not have to be unclamped to change the cutting edge.
 Tighten the clamping screw to 1.2 Nm using a torque screwdriver.

Reinforced version V and version "FC" (fast change) with internal cooling

Usage notes:

To avoid problems, two Y-AXIS holders must not be mounted directly next to each other. Mount a standard tool holder between the Y-AXIS holders.

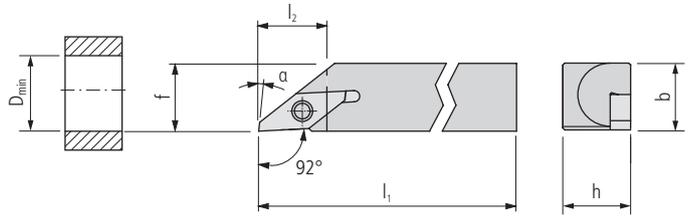

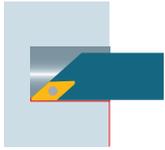

To prevent collisions, move back the holder in accordance with the overhanging length before changing the tool position.

$$d_{max} = \frac{(z_1 - z_2)^2 + x_1^2}{x_1}$$

multidec®-BORE MICRO provides a wide range of inserts for miniaturized ID-turning (diameter between 0.5 and 8 mm). Sharp edges, small radii and ground surfaces guarantee accurate cutting. multidec-BORE MICRO is excellent for machining of common materials as well as exotic alloys. multidec®-BORE MICRO carbide tools are available with wear-resistant coatings as well as uncoated. The heat-treated tool-holder SDA ... can be fixed in a usual chuck or ID tool station. The inserts can be replaced by hand without any measuring or adjusting of axial and radial position. The unique clamping nut ensures accurate location of the boring tool and prevents vibration.

334

UTILIS
multidec®
swiss type tools

Advantages:

- For internal machining methods with small diameters:
 - high positioning accuracy
 - internal cooling system and
 - smallest internal diameter of 0.5 mm
- Sharp cutting edges
- Different coatings are available
 - tenacious carbide grade
 - coated and uncoated

The Superclamp holder offers higher holding forces and better stability, needed especially for broaching, hard cutting with CBN and machining of finest surfaces with PCD, CVD-Diamond and MCD, in non-ferrous materials.

AKR-Mono is a holder for use on the outside turning position when no more inside holder fixing space is available.

Recommendations for thread cutting 170

Polygonal punching is a chip-removing procedure for manufacturing of inside profiles in holes which are usually not continuous. During this procedure, the tool is pushed into a hole in several so-called strokes, and the outline of the broaching tool is introduced into the workpiece.

We can supply square, hexagonal and TORX broaching tools made from carbide from our standard product range. We can also manufacture customised shapes and intermediate sizes on request.

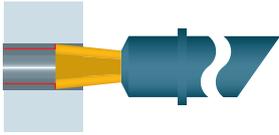

Benefits:

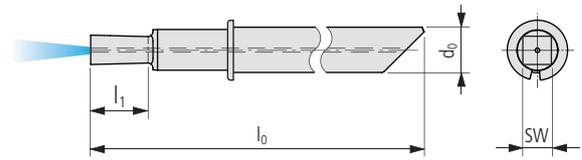

- Short machining times
- Complex geometries with sharp edges are possible
- Full profile tools reduce the number of strokes
- Reliable process with long tool life

Procedure recommendation for broaching of polygonal profiles

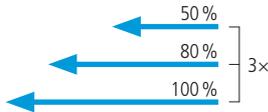

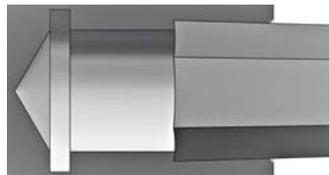

1. Create a tap hole (A) $\varnothing 0.02 - 0.05 \text{ mm} <$ than the width across flats (B), with a chamfer size of $0.02 - 0.05 >$ than the width across flats. Chamfer angle $90 - 120^\circ$.
2. Drilling depth of tap hole (C) $0.15 - 0.2 \text{ mm}$ deeper than the multi-edged profile (D).

$$A_{\min} = B - 0.02 \text{ mm}; A_{\max} = B - 0.05 \text{ mm}$$

$$C = 0.15 - 0.2 \text{ mm} > D$$

3. To avoid chip adhesion in the blind hole, radial undercut (E) $\varnothing 0.02 - 0.05 >$ than the radius of the broaching tool (F). Recess width (G) $0.2 - 0.5 \text{ mm}$.

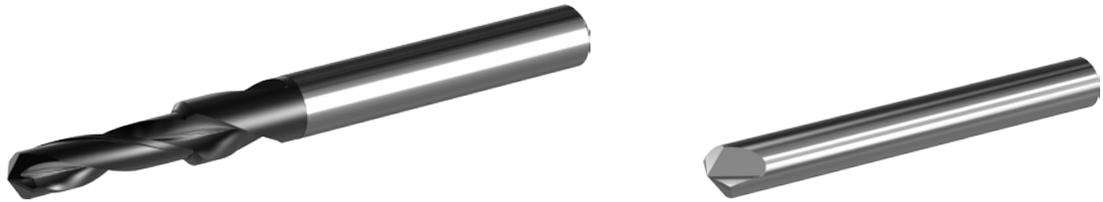

4. Feed: $25 - 30 \text{ mm/min}$ for titanium and stainless steel, up to 150 mm/min for materials with less strength (brass and low alloyed steels).
5. Cut distribution: 50% , 80% and 100% of cutting depth in three strokes (remove chips after each stroke).

multidec®-DRILL contains of a wide range of high-precision solid carbide drills and centre drills. This includes the range from Ø 0.5 to 6 mm and centre drills with tip angles of 90°, 120° or 140°. multidec®-DRILL is characterised by its high stability and precision, and makes a decisive contribution to achieving high quality because of its excellent positioning capability and self-centering characteristic, and makes the work easier. The design also provides good chip removal and the tool life is increased significantly because of the HX and TX+ coatings.

374

Benefits:

- High degree of accuracy and stability
- Self-centering
- Excellent positioning capability
- Good chip removal
- Complete range of solid carbide twist drills from Ø 0.5–6 mm
- Centre drills with tip angle of 90°, 120° or 140°
- HX and TX+ coatings for longer tool life
- Diameter coordinated to metric thread sizes
- Intermediate sizes possible on request

In thread milling, the thread is produced by helical interpolation. The cutting process enables threads with one or two teeth to be obtained with a nominal diameter of 1 mm or more.

Advantages:

- The thread depth is equal to the drill depth
- Lower torque than with tapping and roll form tapping
- Short milling chips avoid chip problems
- High Speed Cutting (HSC) possible
- Reliable process with longer life time

The use of a tool with just one row of teeth is needed in the following situations:

- If there is not enough room in the bottom of the blind hole.
- If the cutting pressure with a tool with two rows of teeth is too great.
- If the tool is also used for deviating pitches.

$$v_f = z \cdot f_z \cdot n_1$$

$$n_1 = \frac{v_c \cdot 1000}{\pi \cdot d_1}$$

$$n_2 = \frac{v_f}{\pi \cdot d_1}$$

Explanation

- v_f Feed (mm/min)
- d_1 Tool diameter (mm)
- n_1 Tool revolutions (rev/min)
- d_4 Work piece diameter (mm)
- n_2 Revolutions (rev/min)
- v_c Cutting speed (m/min)
- P Pitch (mm)
- l_1 Length of one milling pass (mm)
- z Number of teeth
- d_3 Drilling diameter (mm)
- f_z Feed per tooth (mm)

Determine the drilling diameter

For the preparation of drilling before thread whirling, it is necessary to know at first the tolerance of the desired thread. To avoid overload of the tool the diameter must not exceed the max. diameter as mentioned in the following table.

Example: M 1.4, pitch 0.3, tolerance desired of the thread 6H on high level (1.11)

Diameter of the hole to be drilled min = 1.11 – (2 × 0.04) 1.03 mm minimum

Engraving is a chip-removing procedure for which ornaments, text and decorations are cut into the material. The removal of the material creates a surface structure which visually stands out against the background. Engravings manufactured in this way have the advantage of greater durability than other procedures.

The product range includes standardised, finished-ground carbide graters which provide extremely good performance in all materials and also pre-ground semifinished products for grinding yourself.

Benefits:

- Standardised tools with point angle of 30° for engraving from 0.2 to 2 mm
- Pre-ground blanks, with lapped chip surface, available for individually grindable tools
- Sharp cutting edges
- Reliable process with long tool life

multidec®-WHIRLING is a multiple cutter thread whirling tool system designed to significantly improve productivity – essential in today's mass production. Unlike single point threading which requires multiple passes, thread whirling produces a finished thread free from burr in a single pass. The use of up to 12 cutting inserts greatly reduces machining time. For optimized use, UTILIS supplies variants for specific machines with different cutting diameters and lengths.

The inserts used in multidec®-WHIRLING are based on those in multidec®-CUT. This groove/lathe tool system is ideal for Swiss type turning machines with a maximum bar passage diameter of 10 mm. The inserts have two cutting edges that are screwed onto the holders with a repeat accuracy of <math>< 0.01\text{ mm}</math>.

Specialities and advantage:

- Up to 12 inserts increase productivity and reduce vibration considerably
- Little concentricity tolerance and high exchange accuracy of inserts $< \pm 0.005\text{ mm}$ guarantee threads of high-quality
- Quick and simple change of the Whirling tool reduces set up time
- Threads without cutting ridge decrease re-machining of parts
- Using UTILIS standard blanks allows short delivery time and best possible coating for demanded application
- Whirling tools with different flight circles and multi start threads available

MWT... (Type A)

xModular-System

Flexible, two-part system, which reduces set-up time with the fast change whirling ring (the adapter remains in the whirling device); guaranteed concentricity of $\pm 0.005\text{mm}$.

MWT... (Type B)

Mono-system

Highly compact single component system. This enables high concentricity of $\pm 0.005\text{mm}$ to be achieved.

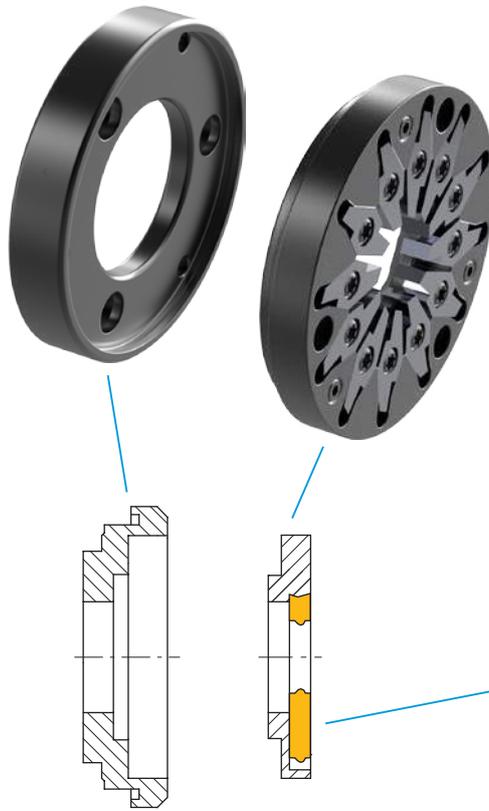

MWT... (Type C)

QuickChange-System

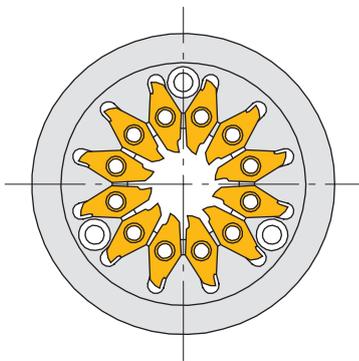

Unlike the xModular-System the whirling ring is removed or inserted by rotation. Here too, the guaranteed concentricity of $\pm 0.005\text{mm}$ is maintained.

*** Note**
The flight circle (D_F) of the insert must match that of the whirling head.

The multidec®-WHIRLING box contains tools for daily use on the machine. The protective foam inlay ensures that the parts are always located at the same place in the case. Spaces are provided for the whirling head for specific applications and the matching whirling plates (4 unmounted sets in all). Dummies can be supplied optionally to protect vacant plate positions.

Illustration with whirling head and plates (these have to be ordered separately)

Contents:

- Handle for torque screwdriver 1.2 Nm
- Alternative torque screwdriver blade for Torx screws
- Allen key
- High performance grease
- Spare screws for the whirling adapter and whirling ring
- Spare Torx screws for the indexing plates

STARTER-SET

Order designation

Starter-Set

The digital inclinometer gives you more flexibility in machine set-up and adjusting the thread pitch angle. The calculation and complicated movement by a certain distance are not required, particularly since the space situation in machines is not always the best. The UMI DI-490 (MEMS principle = Micro-Electro-Mechanical System) consists of a compact housing. Three magnets on the underside makes the attachment in the machine compartment easier. The zero point can be calibrated and stored internally, in order to change between relative and absolute measurement at any time.

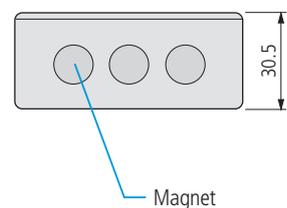

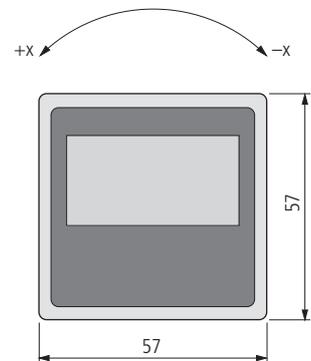

UMI ...

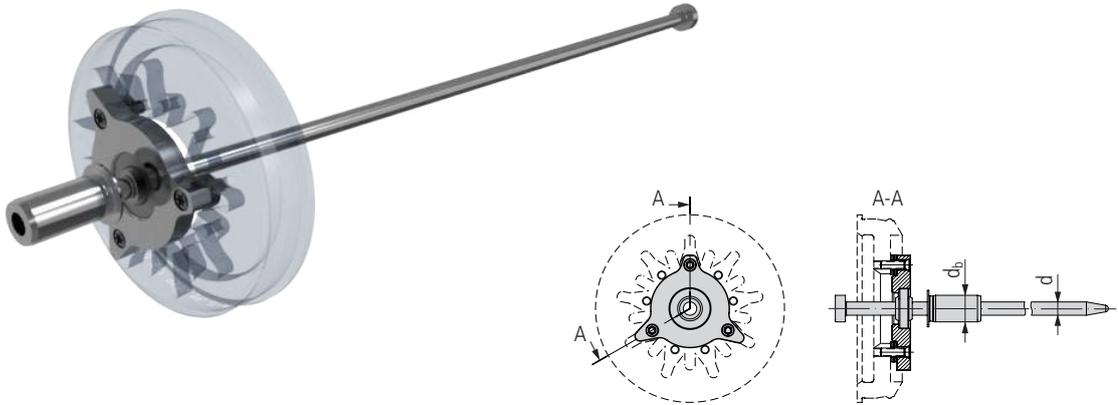

Order designation
UMI DI-490

Technical data:

- Measuring accuracy 0.2°
- Measuring range (X) 4 × 90°
- Display resolution 0.05°
- Temperature range 0 to 40 °C
- Weight 200 g
- Protection class IP54

Centering device for manual adjustment of the point height compensation with 3 different sizes of centering adapter for the guide bushing.

$$\tan \delta = \frac{P}{\pi \cdot d}$$

$$\delta = \frac{\arctan \cdot P}{\pi \cdot d}$$

$$v_f = z \cdot f_z \cdot n_t$$

$$n_t = \frac{v_c \cdot 1000}{\pi \cdot D_F}$$

$$n_b = \frac{v_f}{\pi \cdot d_3}$$

456

$$Y = \sin \delta \cdot \Delta L_T$$

Please visit our website www.utilis.com for further thread whirling calculations

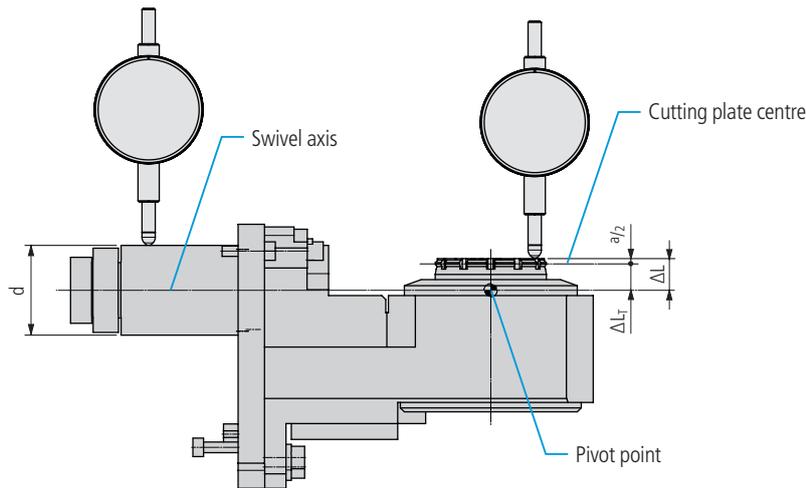

Explanation

- d₃ Core diameter (mm)
- d₄ Thread diameter of work piece (mm)
- D_F Flight circle (mm)
- D_G Max. bar passage diameter (mm)
- D_M Ring diameter outside (mm)
- f_z Feed per tooth (mm)
- L Overhang length (mm)
- ΔL_T Positioning relative to the pivot point (mm)
- n_t Tool revolutions (rev/min)
- n_b Work piece revolutions (rev/min)
- P Pitch (mm)
- v_f Work piece feed (mm/min)
- v_c Cutting speed (m/min)
- Y Tip height adjustment
- z Number of teeth
- δ Lead angle (°)

The measurement of the length difference ΔL_T is appropriate for determination when the following situations exist:

- new whirling tool or holder
- checking the ΔL_T
- after a machine collision
- point height compensation

Outside the machine the length difference ΔL_T must be determined using the height measuring device for calculating the point height and correcting it if necessary using the following procedure:

1. The swivel axis is usually the centre axis of the arbor. In order to do this, the diameter d must be measured and halved. This position must be zeroed and used as a reference for further measurement.
2. We take the uppermost surface of the cutting edge as the second measuring point. The difference results in ΔL
3. Use dimension $a/2$ (half the cutting edge width) in accordance with the whirling tool designation for the remaining calculation. The length difference ΔL_T is calculated from this, whereby the exact point height compensation can be adjusted.

See usage examples 456

Whirling tool designation	$a/2$	ΔL	$\Delta L_T = \Delta L - a/2$

Tool Systems enables UTILIS inserts to be used on various well-known lathe tool systems. High quality UTILIS inserts like multidec®-CUT, -TOP and -BORE MICRO can therefore also be fitted on other manufacturers' cutting tool interfaces. This gives users maximum flexibility and independence. On the following pages, UTILIS proposes a wide range of holders for tool systems and machine-based tool systems.

multidec®-SHORT is a range of holders with short holders multidec®-CUT, -ISO and -TOP indexable inserts. All holders are equipped with internal cooling.

Benefits:

- All holders feature three connecting options for the coolant supply
- Fixed coolant discharge, therefore low build-up at front at the holder
- With or without high pressure, the coolant medium always hits the cutting edge precisely

Compatibility with QS quick tool change system:

multidec®-SHORT holders can also be used in the QS quick tool change system from Sandvik Coromant. The coolant transfer tube can be screwed into the holder at the rear fur using the internal coolant supply.

TORX screwdriver 651...

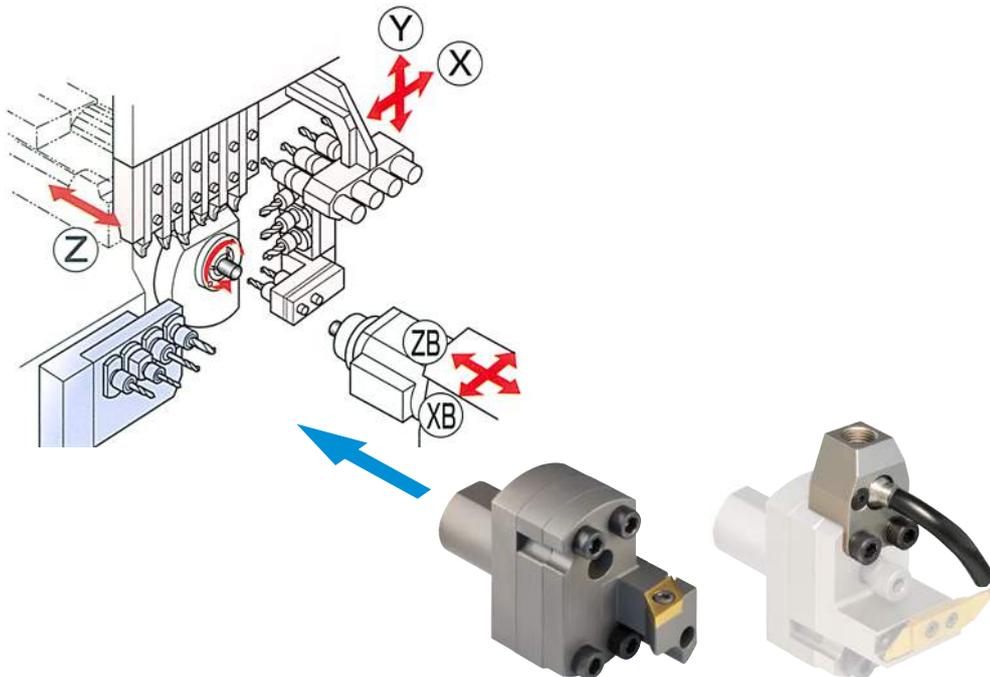

multidec®-BACKTOOLS is a product range used for reverse-side machining on Swiss type turning machines with counter spindles. The tool enables a part to be fully machined in a single operation.

This modular system is characterized by outstanding stability and versatility.

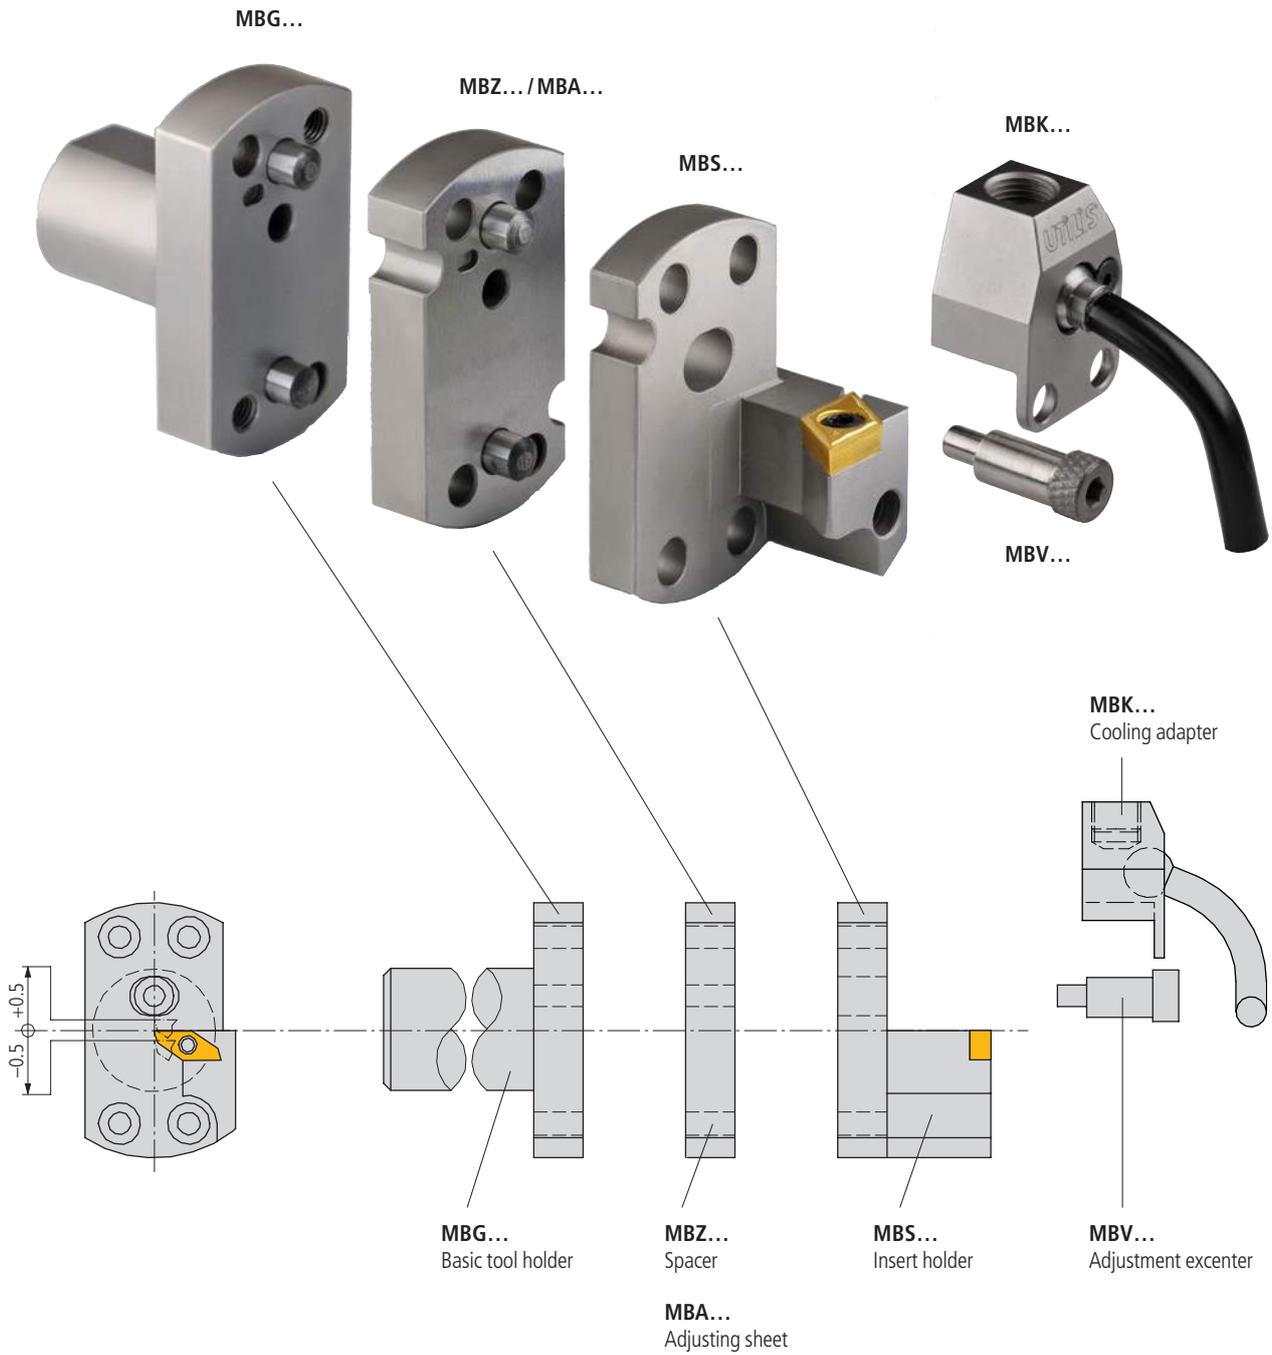

Advantages:

- Complete machining in a single operation is possible
- High stability
- Modular design
 - Basic tool holder
 - Spacer
 - Insert holder
- Precise and convenient center height adjustment by means of an excentric screw for machines without Y-axis (± 0.5 mm)
- Internal cooling possible
- Basic tool holder for common machines

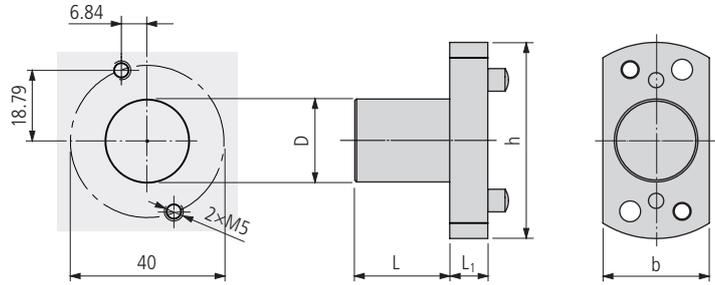

Technical information		11
Mounting		476
Basic tool holders / Double basic tool holder		477
Basic tool holders for PCM broaching toolholder		491
Special combination holder and collet holder		492
Direct combination holder		494
Holders for inserts		495
Holders for OD turning tools		506
Collet holders / Extension attachment		507
Holders for ID turning tools of multidec®-BORE MICRO		509
Holders for ID turning tools		510
Reduction sleeve		511
Spacer and adjusting sheet		512
Cooling adapter		514
Replacement and spare parts		589

multidec®-MODULINE is a modular tooling system with an ideal range of options designed to meet the requirements of different machines available on the market.

Grooves along the length of its base ensure excellent rigidity and precise positioning. Longitudinal positioning is ensured by a fixed (...f) or adjustable (...a) peg held in place under pressure by a sprung bearing.

A specific MODULINE tool holder plate can replace the original plate. This way, gains in reliability and tool changeover speed are very high.

Special features and advantages:

- More tool holders per available space bring a significant productivity gain
- Easy and quick tool replacement, with presetting on fixed or adjustable length
- Stable and reliable tool location system with longitudinal serrations and large square shanks
- Versatile tooling system, easy to use, possible combination with standard tools and coolant supply devices
- Wide range of holders for multidec®-ISO, -TOP and -CUT inserts
- Applitec-compatible

Overview – multidec®-MODULINE

multidec®-KM™ is a precise and robust quick-change system for automatic lathes with an interface to ISO standard 26622.
 UTILIS has suitable holders for multidec®-CUT, -TOP and for multidec®-BORE MICRO inserts for the KM Micro™ system.

KM™ is a Trademark of Kennametal Inc.

Advantages:

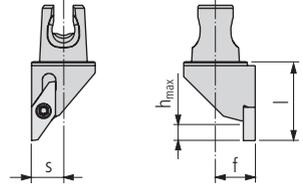

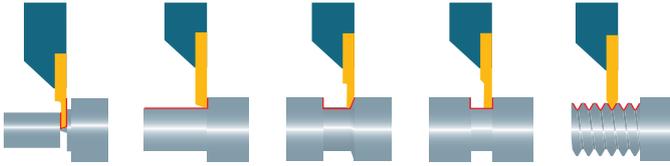

- Fast and simple installation of KM™ basic tool holders into the existing tool positions
- Quick tool changes
- Annealed holders
- High-quality multidec® cutting edges

TORX screwdriver 651...

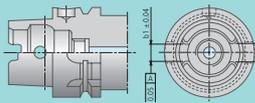

Use of the multidec®-HSK-system with ISO 12164/DIN 69893 standardized attachment has become increasingly widespread in recent years. This system makes the customer independent from specific tool system, which is a great advantage. Simplicity, precision and reliability: these are the criteria that customers place on modern tool systems. HSK tools largely satisfy these demands and help to maximize productivity. The program comprises a wide selection of tool holders for both OD and ID turning on lathes. The standard range has been developed in size 32 and form "C" for manual tool changing. Now we propose a new size 40 in form HSK-T for the automatic- and manual tool change. Other HSK shapes and sizes are available on request.

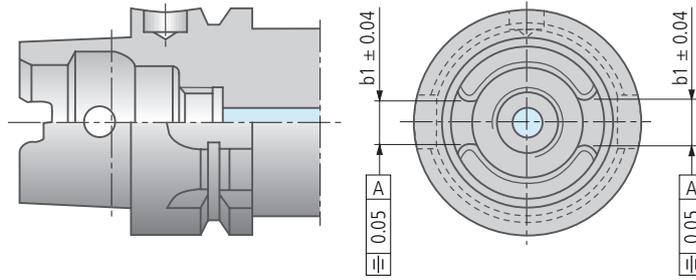

Advantages:

- Large program of toolholders in heat-treatable steel, with internal cooling, available from stock
- Holder with high rigidity and repeat accuracy
- High precision in positioning of cutting edge, cause of the axial positioning and the close tolerance of the holder keyway HSK-T standard ISO 12164
- Utilisation of high quality UTILIS multidec®-inserts

Overview – multidec®-HSK

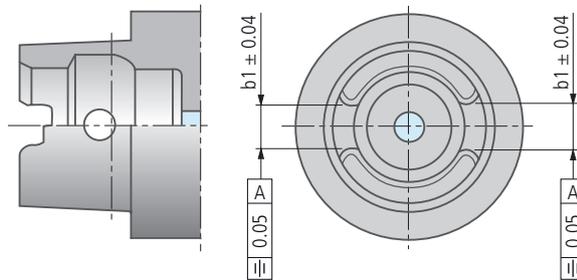

Technical information		11
HSK-versions		538
Holders (IOD turning)		540
Holders (ID turning)		544
Closing plug		546
Replacement and spare parts		547

HSK – Form A

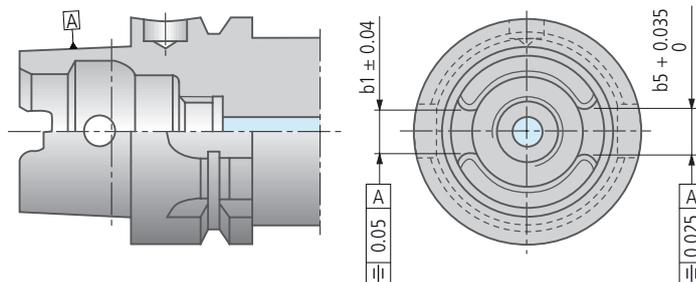

- Used on machining centers, milling machines, turning machines, special machines with automatic tool change
- Central, axial coolant supply through coolant tube
- Torque transmission via two key slots at end of taper
- Two slots on collar for tool magazine, location edge hole for data carrier in collar

HSK – Form C

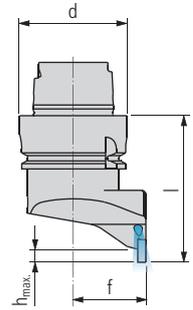

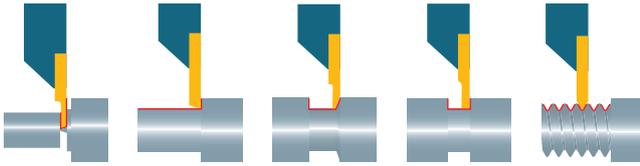

- Preferably used for spindles on transfer lines and special machines without automatic tool change or for short bore spindles and tool extensions and reductions
- Central, axial coolant supply
- Torque transmission via two key slots at end of taper

HSK – Form T

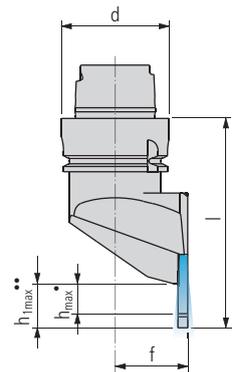

Tighter tolerance for perfect change precision

The "T" stands for "Turning". HSK-T combines the basic shape of the HSK taper in form A/C and differs by closer tolerances of the cam grooves on the cone of the tools. This important feature for turning assures accurate radial positioning (center height).

TORX screwdriver 651...

multidec®-PSC is a flexible and modular quick change toolholder-system, with a polygon-connection compliant with ISO 26623-1 standard. High torque transmission is one basic advantage of the system. The program includes tool holders suitable for turning machines with multidec®-CUT, multidec®-TOP and multidec®-BORE MICRO inserts.

Advantages:

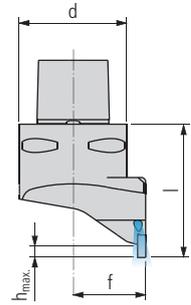

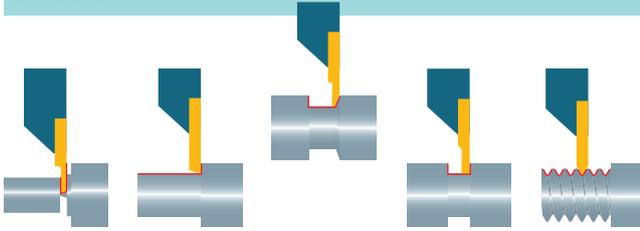

- Connection with high rigidity, repeat accuracy and self-centering
- Quick change of toolholders
- Toolholders with heat-treatable steel and internal cooling
- Utilisation of high quality multidec® inserts

TORX screwdriver □ 651...

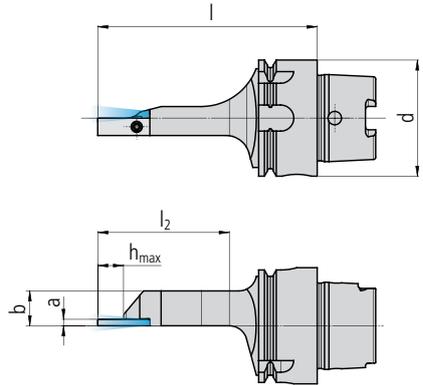

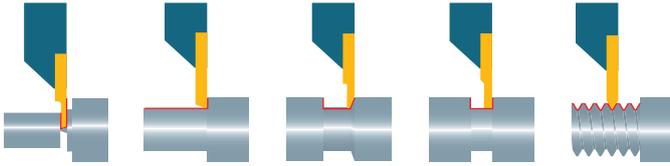

Solid and compact tools are an enormous advantage for turning operations on multitask machines. Specially-designed tools must be used with the machine spindle during the turning process that can allow work to be done very close to the main or opposed spindle. Any errors in the height of the cutting edge and torsional forces should also be kept to a minimum. With the HSK-E40, HSK-T32, HSK-T40, HSK-A40 and PSC 40 (Capto C4) spindles, this sophisticated range of tools offers ideal solutions for modern turning and milling centers.

Advantages:

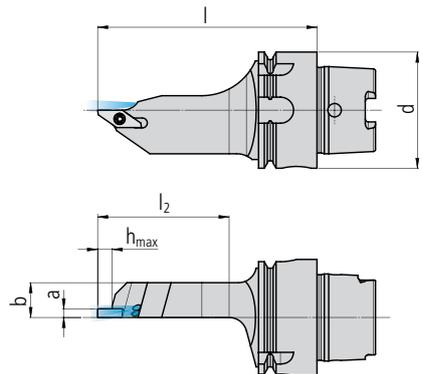

- Monoblock tools with interchangeable inserts
- Compact and solid design
- The insert is positioned on the center line (guaranteeing a very accurate cutting edge height and high repeatability while also reducing of the load on the spindle)
- All tools are equipped with integrated coolant supply
- The high quality UTILIS inserts from the multidec®-CUT, -ISO, -TOP and -BORE MICRO series can be used

ESCOMATIC machines are known as versatile and flexible automatic turning centers for the low cost manufacture of complex work pieces in small and large batch sizes. Material is fed from the coil with a straightening unit or from a bar loader. UTILIS has developed a range of insert holders for various machine types.

Advantages:

- Elaborate program of toolholders, available from stock
- Nickelized toolholders with heat-treatable steel
- Utilisation of high quality multidec® inserts
- Quick change of inserts in the machine or presetting outside of the machine
- Significant reduction of machine downtimes

For the rotating tool heads of machine types ECO8, EC12, Newmach NM 64X, NM 6 Flexi, NM 6 TWIN and NM 8, the program includes tool holders which are suitable for multidec®-CUT, multidec®-TOP and ISO standard inserts.

ESCO offers a modification of the existing chuck on the D2, D4 and D5 machine types, where the basic holders for the cranks can be replaced with insert holders. Following this modification, holders for UTILIS inserts can then be attached.

Important: In order to guarantee perfect functionality, modifications may only be made by ESCO. UTILIS only supplies the holders and the corresponding inserts.

The following machine types can be modified:

D2, D2 Flex Speed, D5 Flex Speed, D2-CNC, D2-CNC-UP, D4, D5, D5-CNC, D5-Twin and D5-Ultra

For the machine type D6, we recommend a new exchange kit. This new holder and insert system will replace the old system with monobloc tools.

Cut-off operation near the spindle or the sub-spindle is frequently difficult with standard-tool holders. The cutting edge is too far away or the tool holder collides with the spindle. Adapted special tool holders are the solution in this case.

This program proposes to use multidec®-CUT and -TOP inserts, adapted tool holders and modules for machines of DECO 7, DECO 10, EvoDECO 10, DECO 13, EvoDECO 16, DECO 20, DECO 26 and EvoDECO 32.

TORNOS

Advantages:

- Adapted tool-holders with internal cooling, nickel plated and made from heat treated steel, available from stock
- Increased stability by direct attachment of tool holders on the machine base plate
- Cutting edge near the spindle/sub-spindle
- Cut-off of small parts without problems
- Utilisation of high quality multidec®-CUT inserts

Product description

Development and production of multidec® tools for your own specific needs.

Customer's situation

A special machining situation is very difficult or impossible to be resolved by using tools from the standard multidec® range. For this, a special tool or a standard tool with a different dimension is required.

UTILIS solution

After detailed consultation, we will develop and make the best multidec® solution for your particular needs. Normally this will be done using standard blanks which enable the special tools to be produced and delivered quickly and at reasonable cost. The familiar multidec® quality is of course always guaranteed.

Advantages:

- UTILIS know-how and quality, even for special solutions
- Targeted new development in accordance with customer requirements is possible
- Construction with many years of experience
- Modern manufacturing with the best machinery

Equipping with PCD, CVD diamond or CBN cutter possible by request.

Inquiry

multidec4you®

The feasibility study starts in the technical office when your inquiry is received and the first estimate of the costs is then worked out with the involvement of the production. Competent product managers will prepare a tailor-made solution for you and provide you with a quotation.

Accessories

Accessories are well-suited products to be used in combination with cutting tools in different machining applications. They aren't related to a specific tool system.

Clamping and cooling system – multidec®-LUB

The multidec®-LUB clamping shim directs the coolant precisely onto the tool insert, even at low pressure. The flexible stop allows for the tool holder to be replaced safely and quickly. The supply of coolant under high and low pressure is made through a distributor block or directly in the multidec®-LUB clamping shim.

Coolant distributors with two to eight outlets, hoses in a range of different versions and lengths, plus diverse fittings and quick couplings are available as accessories for complete high-pressure and low-pressure solutions.

Benefits:

- Simple installation through replacement of the original clamping shim with the multidec®-LUB clamping shim
- The service life of the insert is increased as the removal of chips and heat is improved thanks to the precise positioning of the cooling on the cutting edge
- Increased process reliability
- Use of the clamping shim at pressures of 30 to 200 bar or 435 to 2900 psi
- Quick and safe replacement of the insert thanks to integrated stop
- Tool holders without internal cooling (IC) can continue to be used
- The clamping shim can be used under high and low pressure
- For right-hand and left-hand tool holders
- The clamping shim has two connecting options for the coolant supply
- Different coolant distributors, hoses and push-in fittings for high and low pressure
- Torque screwdriver for precise clamping of the tools

Order guideline

617

The designation of a clamping wedge contains all of the important information, which is put together in accordance with the following system:

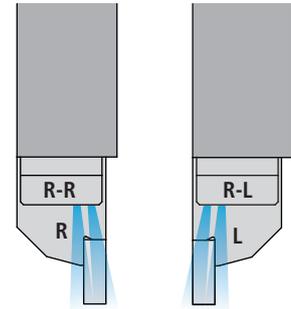

Clamping shim

MLU CI - 12 - R-R IC - F

* R-R: Clamping shim for right-hand holders "R"
R-L: Clamping shim for left-hand holders "L"

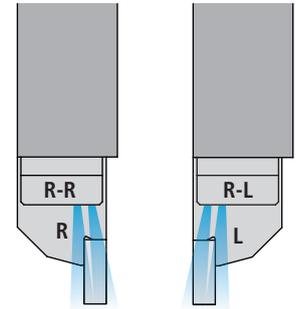

MLU CI-... IC F (CITIZEN)

R-R: Clamping shim for right-hand holders "R"; R-L: Clamping shim for left-hand holders "L"

In order to determine the correct multidec®-LUB clamping shim, we require the exact dimensions of the tool plate and clamping shim. Therefore, please send these to us as a sample for measurement or use the form to send us the required information.

Attention

The positions in the tool plate are not always identical. Therefore, measure the position where you want to use the multidec®-LUB clamping shim exactly.

The newly developed high-pressure solution from UTILIS (up to a maximum of 200 bar or 2900 psi) ensures optimal delivery of coolant to the insert.

The highly compact and robust design and the stainless steel finish are the main features of this product.

The product range includes several straight and pivoting unions with connection diameters of 4 mm and several quick connections. The use thereof dispenses with the laborious task of unscrewing the high-pressure tubes. This increases efficiency by minimising machine downtime.

The high-pressure hoses are available in a wide variety of lengths with different connections.

Reduction unions, extensions, screw connections, spare parts and coolant distributors round off the product range.

Benefits:

- Flexible enough to be used with all multidec® product lines with internal cooling
- Can be used within a temperature range of –60 to +250 °C or –76 to +482 °F
- Can be used up to a maximum operating pressure of 200 bar or 2900 psi

The range associated with the low-pressure solution for operating pressures up to a maximum of 30 bar or 435 psi includes a straight union and a swivel-type union with a connecting diameter of 4 mm when a polyurethane tube is being used.

As with our high-pressure solution, we offer reduction unions, extensions, closing plugs, and sealing rings. The polyurethane tube with an external diameter of 4 mm is 1000 mm long. This allows you to cut it to the length you need on a case-by-case basis.

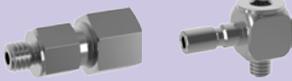

A well-balanced range of compact coolant distributors made of light metal completes the offer.

Benefits:

- Flexible enough to be used with all multidec® product lines with internal cooling
- Can be used up to a maximum operating pressure of 30 bar or 435 psi (test pressure of 30 bar or 435 psi)
- Corrosion-resistant and compact design

Overview – Coolant system

Connecting options		620

Initial assembly

1. Screw on the union nut by hand until finger-tight. At the same time, push the tube against the fitting.
2. Tighten down the union nut through **1¾ rotations** using an open-end wrench.
 - 1 Making a mark will assist in correct rotation. Hold the adaptor with a second wrench to prevent it turning.

**Repeat assembly**

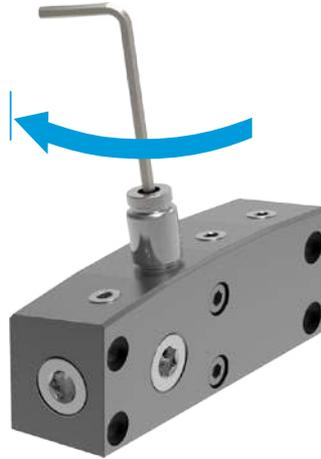

When refitting the same tube union, screw the union nut back on by hand until finger-tight and tighten down the union nut with an open-end wrench with **¼ of a rotation** for the final fit.

In the event of repeat fitting, parts must be lubricated.

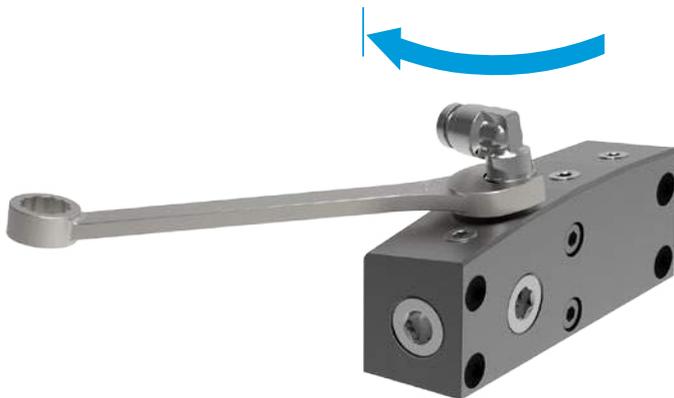

Installation of the straight plug connector

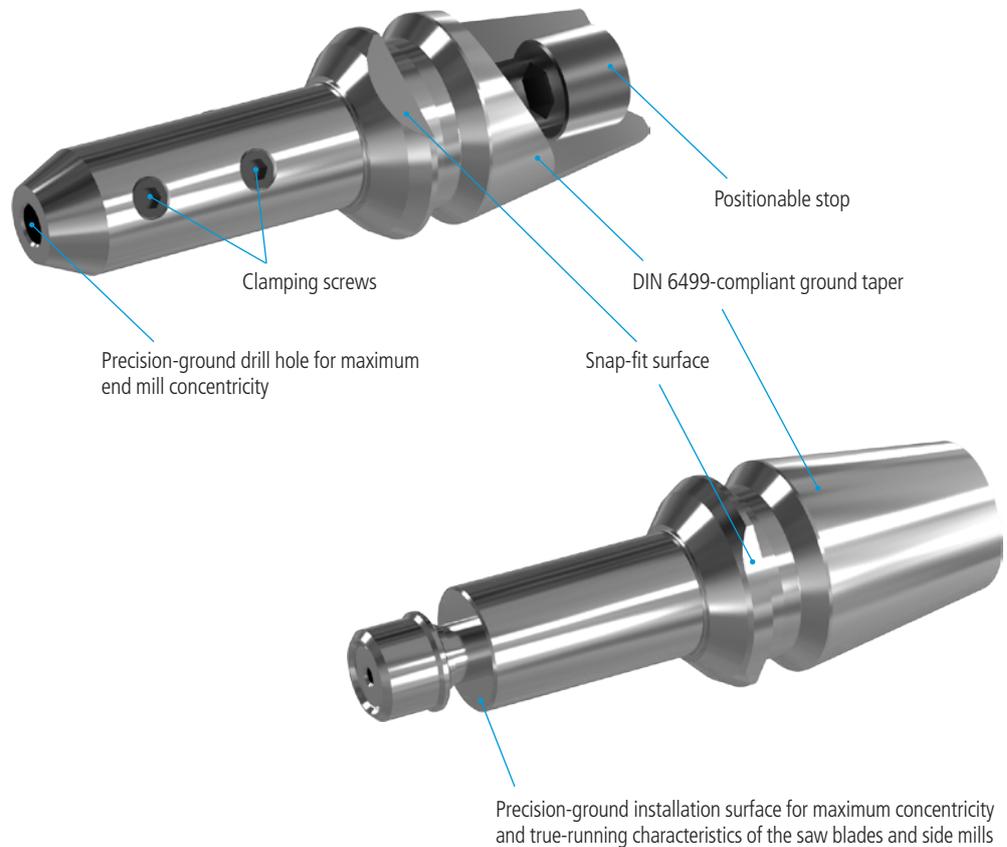

1. Screw on the straight plug connector by hand until finger-tight.
2. With the Allen key, thoroughly tighten the straight plug connector (as shown) through the opening for the connection using the force of your fingers only.

**Installation of the swivel-type plug connector**

1. Screw on the swivel plug connector by hand until finger-tight.
2. With an open-end wrench, thoroughly tighten the swivel-type plug connector (as shown) using a normal amount of force.

multidec®-TAPER-IN is a tool holder serie that has been specially developed to be used on Swiss type turning machines. These tool holders have a monoblock design in order to achieve the highest possible stability. The multidec®-TAPER-IN tool holders can be used in any driven or stationary spindle compliant with the DIN 6499 standard.

Benefits:

- Ideally suited to Swiss-type turning machines (profile turning)
- Direct fit in the collet chuck with ER cone
- No special clamping nuts are needed
- Monoblock design for reduced added tolerance
- High stability
- Ground surfaces
- Holder for ER sizes 8, 11, 16, 20 and 25
- Concentric accuracy of 0.005 mm
- Stop screw adjustable on both sides for tool positioning

Overview – multidec®-TAPER-IN

Screwdriver

Maximum possible hardness combined with high toughness are essential for any high quality tool. Use of a special alloy gives our blades exceptional toughness and elasticity even at a hardness of 58 to 60 HRC.

The special surface structure of the handle gives a firm grip even with wet and oily hands. Safe working and a long tool life are guaranteed with this screwdriver.

Overview – Screwdriver

These collets are made in-house by UTILIS and can be supplied from stock. They are manufactured for universal use with all screw-fitted milling cutters which have the same interface-specific application. To be used as ER adapters they offer several advantages, even by comparison with full carbide shank milling cutters.

Special features and advantages:

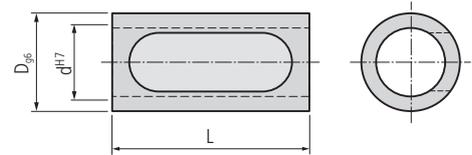

- Short and stable tool clamping
- Suitable for use on both, Swiss type lathes and regular short turning lathes
- Fewer vibrations than carbide endmill (less wear/tool breakage)
- Lower tool costs
- Higher cutting parameters than carbide endmill
- Also suitable for low power machines
- Concentricity <0.005 mm

The reduction sleeve gives the possibility fixing small tools in to the machine tool fixtures with bigger diameters. This small investment is an extremely flexible and economic solution giving an independent solution for different tool fixing situations.
